Abstract

A total of 81 Tyranniidae birds were examined, 80 *Pitangus sulphuratus* (Linnaeus, 1766) (Great kiskadee), and one *Machetornis rixosa* (Vieilot, 1819) (Cattle tyrant), for collection of nasal mites, which were identified as *Ptilonyssus spinosus* (Brooks & Strandtmann, 1960) and *Sternostoma longisetosae* (Hyland, 1961) (Rhinonyssidae). This finding characterises the first report of *P. spinosus* and *S. longisetosae* in *P. sulphuratus*, and the first record of *P. spinosus* in *M. rixosa*, and expands the geographic distribution of these species. It is the first occurrence of *S. longisetosae* in the Neotropics, and the first citation of *P. spinosus* in the state of Rio Grande do Sul, Brazil.

Keywords: *Pitangus sulphuratus*, *Machetornis rixosa*, Rhinonyssidae.

Ácaros nasais de Tyrannidae (Aves) no Brasil

Resumo

Foram examinadas 81 aves Tyranniidae, 80 *Pitangus sulphuratus* (Linnaeus, 1766) (Bem-te-vi) e um *Machetornis rixosa* (Vieilot, 1819) (Suiriri-cavaleiro) para coleta de ácaros nasais, os quais foram identificados como *Ptilonyssus spinosus* (Brooks & Strandtmann, 1960) e *Sternostoma longisetosae* (Hyland, 1961) (Rhinonyssidae). Este achado caracteriza o primeiro relato de *P. spinosus* e *S. longisetosae* em *P. sulphuratus* e o primeiro registro de *P. spinosus* em *M. rixosa*, e amplia a distribuição geográfica destas espécies, sendo a primeira ocorrência de *S. longisetosae* na região neotropical e primeira citação de *P. spinosus* no Rio Grande do Sul, Brasil.

Palavras-chave: *Pitangus sulphuratus*, *Machetornis rixosa*, Rhinonyssidae.

1. Introduction

Pitangus sulphuratus (Linnaeus, 1766) (Great kiskadee) is endemic in the American continent. It is distributed from the United States (Texas) to Argentina, occurring throughout the Brazilian territory (Sick, 1997). *Machetornis rixosa* (Vieilot, 1819) (Cattle tyrant) occurs in Venezuela, Bolivia, Paraguay, Argentina, Uruguay, and in Brazil from the state of Maranhão to the state of Rio Grande do Sul (Mendes et al., 2000).

In Brazil, studies with nasal mites underwent great advances between the 1940s and 1970s, with works performed by De Castro (1948), Pereira and De Castro (1949), Amaral (1968) and Amaral and Rebouças (1974). They described new species of nasal mites parasitising several species of birds. In the state of Rio Grande do Sul, Paulsen (2006), Sinkoc (2006) and Mascarenhas et al. (2009) described the occurrence of *Rhinonyssus rhinolethrum* (Trouessart, 1895) in *Netta peposaca* (Vieillot, 1816); *Dendrocygna viduata* (Linnaeus, 1766) and *Dendrocygna bicolor* (Vieillot, 1816); *Callonetta leucophrys* (Vieillot, 1816) and *Cygnus melanocoryphus* (Molina, 1782), respectively.

Coimbra (2007) reported the parasitism in *Columbina picui* (Temminck, 1813) by *Mesonyssus* sp., Avancini (2009) reported the parasitism by *Rhinonyssus* sp. in *Vanellus chilensis* (Molina, 1782), and Mascarenhas et al. (2011) reported *Ptilonyssus sairae* (Castro, 1948) and *Sternostoma pirangae* (Pence, 1976) in *Paroaria coronata* (Miller, 1776). In this context, this study aims to contribute to the knowledge of nasal mites of Brazilian birds.

2. Material and Methods

Tyrannidae birds, a total of 81, being 80 *Pitangus sulphuratus* and one *Machetornis rixosa*, from these 59 *P. sulphuratus* were sent by the Núcleo de Reabilitação da Fauna Silvestre e Centro de Triagem de Animais Silvestres da Universidade Federal de Pelotas (NURFS-CETAS/UFPEL), where the birds died; the others were found dead from having been run over. The birds were from the municipality of Pelotas and neighbouring municipalities which are located between the geographic coordinates

31°00'58.44"S, 52°03'13.34"W and 33°32'06.45"S, 53°21'08.98"W.

The collection of nasal mites was performed by adaptation of the technique of Fain (1957), cited by Amaral and Reboças (1974), the specimens were cleared with lactophenol, mounted between slide and coverslip in Hoyer's medium and examined under an optical microscope. Identification was performed according to Systematic Keys of Pence (1975) and Knee and Proctor (2010), and the original species descriptions made by Brooks and Strandtmann (1960) and Hyland (1961). Parameters of prevalence, mean abundance and mean intensity were estimated according to Bush et al. (1997), as well as the sex ratio between males and females.

3. Results

The nasal mites were listed in the arthropod collection of the Laboratory of Wild Animals Parasitology, Department of Microbiology and Parasitology, Biology Institute, Federal University of Pelotas, with the numbering from 417 to 443.

Of the 80 *P. sulphuratus* examined, ten were parasitised by *Ptilonyssus spinosus* (Brooks & Strandtmann, 1960), four by *Sternostoma longisetosae* (Hyland, 1961). *Ptilonyssus spinosus* has showed a prevalence of 12.5%, mean abundance of 1.1, mean intensity of 8.8, and sex ratio a male for 4.17 females. *S. longisetosae* has showed prevalence of 5%, mean abundance of 0.12, and mean intensity of 2.5. All specimens collected were females.

Machetornis rixosa showed parasitism by two female of *P. spinosus*.

4. Discussion

This mite *Ptilonyssus spinosus* has been reported parasitising Tyrannidae birds in Cuba and in North America (Černý and Dusbábek, 1970, Pence 1975), and in Brazil, Amaral (1963) reported this species parasitising *Tyrannus melancholicus melancholicus* (Vieillot, 1819) in the state of Paraná.

Knee and Proctor (2010) listed the occurrence of *S. longisetosae* in North American (Canada) tyrannids.

In the one bird, *P. sulphuratus*, there was a parasitic association between the two species, *S. longisetosae* and *P. spinosus*. Parasitic association between nasal mites is rarely cited. Pence (1973) reported the finding of multiple species in one host, but he neither indicated which species of mites were involved nor the hosts.

Spicer (1987), in Mexico, has examined 103 birds from several families: four specimens belonged to Tyrannidae, and only one individual of the genus *Empidonax* (Cabanis, 1855) showed parasitic association between the mites *Ptilonyssus tyrannus* (Brooks and Strandtmann, 1960) and *Sternostoma pencei* (Spicer, 1984), concluding that parasitic association occurs sporadically.

Pitangus sulphuratus is a new host for the mites *P. spinosus* and *S. longisetosae*, as well as *M. rixosa* appear as a new host for the nasal mite *P. spinosus*. This report extends the geographic distribution of these species, being

the first occurrence of *S. longestosae* in the Neotropics, and the first citation of *P. spinosus* in the state of Rio Grande do Sul. This is also the first report of parasitic association between *P. spinosus* and *S. longisetosae*.

Acknowledgements – We thank the Núcleo de Reabilitação da Fauna Silvestres e Centro de Triagem de Animais Silvestres da Universidade Federal de Pelotas for donating the animals, and CAPES and CNPq for financial support.
