ABSTRACT. A new species of bufonid toad of the genus *Melanophrynniscus* from northern Uruguay is described. It is included in the *M. moreirae* group and its external morphology is similar to *Melanophrynniscus sanmartini*. *Melanophrynniscus* sp. nov. is distinguished by having a light brown dorsal coloration with six darker longitudinal glandular ridges on the dorsal surface of the body and the gular region uniformly black.

KEYWORDS. Anura, *Melanophrynniscus*, Uruguay.

RESUMEN. Una nueva especie de *Melanophrynniscus* (Anura, Bufonidae) del Uruguay. Se describe una nueva especie de anuro bufónido del género *Melanophrynniscus*, procedente del norte de Uruguay. La nueva especie se incluye en el grupo *M. moreirae* y es similar, en cuanto a su morfología externa, con *Melanophrynniscus sanmartini*. *Melanophrynniscus* sp. nov. se distingue por presentar una coloración dorsal castaña clara con seis cordones glandulares longitudinales más oscuros en la superficie dorsal del cuerpo y la región gular de color negro uniforme.

PALABRAS CLAVE: Anura, *Melanophrynniscus*, Uruguay.

The Neotropical genus *Melanophrynniscus* Gallardo, 1961 is currently represented by 20 species distributed in southern and southeastern Brazil, southern Bolivia, Paraguay, Uruguay and central and northern Argentina (Di-BERNARDO *et al.*, 2006). Although there is no accepted proposal of phylogenetic intrageneric relationships for *Melanophrynniscus*, adult (GRAYBEAL & CANNATELLA, 1995) and tadpole characters (LARSON *et al.*, 2003) suggest monophyly of the genus, and the available phylogenetic hypotheses propose *Melanophrynniscus* as a basal member of the family Bufonidae (GRAYBEAL, 1997; HAAS, 2003; DARST & CANNATELLA, 2004; FAIVOVICH *et al.*, 2005). *Melanophrynniscus* species are arranged in three (CRUZ & CARAMASCHI, 2003) or four phenetic groups (CÉSPEDEZ & MOTTE, 2001). However, these groupings are not based on analytical methods of modern systematics and the only group for which a putative synapomorphy (presence of the frontal swelling) has been suggested is the *M. tumifrons* (Boulenger, 1805) group (BALDO & BASSO, 2004; NAYA *et al.*, 2004).

In Uruguay, there are six known species of *Melanophrynniscus*: *M. atroluteus* (Miranda-Ribeiro, 1920) and *M. montevidensis* (Philippi, 1902) in the *M. stelzneri* (Weyenbergh, 1875) group (*sensu* CRUZ & CARAMASCHI, 2003); *M. sanmartini* Klappenbach, 1968 in the *M. moreirae* (Miranda-Ribeiro, 1920) group (*sensu* CRUZ & CARAMASCHI, 2003); and *M. devincenzii* Klappenbach, 1968, *M. orejasmirandai* Prigioni & Langone, 1986, and *M. pachyrhynus* (Miranda-Ribeiro, 1920) in the *M. tumifrons* group (*sensu* CRUZ & CARAMASCHI, 2003).

The purpose of this work is to describe a new species of *Melanophrynniscus* belonging to the *M. moreirae* group (*sensu* CRUZ & CARAMASCHI, 2003), collected during a monitoring program in the modified woodlands of northern Uruguay.

MATERIALS AND METHODS

Type specimens are deposited at the Vertebrate Collection, Facultad de Ciencias, Universidad de la República, Montevideo, Uruguay (ZVCB). Measurements were taken with calipers to the nearest 0.01mm under a dissecting microscope. The webbing formula is described using methods of SAVAGE & HEYER (1967) and MYERS & DUELLMAN (1982). Drawings were made with the aid of a camera lucida attached to a Leyca MZ6 stereoscopic microscope.

Material examined. *Melanophrynniscus admirabilis* Di Bernardo, Maneyro & Grillo, 2006. BRAZIL, **Rio Grande do Sul**: Arvorezinha (Perau de Janeiro) (ZVCB 11531-33 - Paratypes).

Melanophrynniscus atroluteus. ARGENTINA, **Misiones**: Dep. Apóstoles (Barra Concepción) (MACN 1913-7, MLP DB 647, 651-92, 1423, 1428-30, 1438, 1442-3); Dep. Candelaria (Cerro Corá, San Juan stream) (MLP DB 161, 305-18, 1404, 1407-16, 1418, 1433, 1435, 1437, 1439-41, 1831); Dep. Capital (Villa Lanus, Campus UNaM, 27°26'03.8"S, 55°53'11.3"W) (MLP DB 1425, 1475); Dep. Capital (Junction Prov. roads 105 and 204) (CHUNAM 596-600); Dep. Concepción (Concepción de la Sierra, Campo San Lucas) (MLP DB 176-8, 183-6); Dep. San Javier (Itacaruaré) (MCP 618); **Corrientes**: Dep. Ituzaingó (15 km west from San Carlos) (MACN 29565, 29567); Dep. Santo

Tomé (Santo Tomé) (MFA-ZV.H 028). **BRAZIL, Rio Grande do Sul:** Garruchos (MCP 858-9, 861-5, 867-9); São Jose dos Ausentes (MCP 4607, 4609); Uruguaiana (Km 170 Road BR 472) (MNRJ 27349-50). **URUGUAY, Artigas:** Tomás Gomensoro (MLP DB 3990-2, 3994); **Treinta y Tres:** Bañado de las Oliveras (MLP DB 3993).

Melanophryniscus cambaraensis Braun & Braun, 1979. **BRAZIL, Rio Grande do Sul:** Cambará do Sul (P.N. da Serra Geral, Fortaleza dos Aparados) (MCN 9797- Holotype, MCN 9755, 9757-60, 9762-88, 9790-92, 9794, 9799-9813, MNHN 04993 - Paratypes).

Melanophryniscus cupreuscacularis Céspedes & Alvarez, 2000. **ARGENTINA, Corrientes:** Dep. Capital (Corrientes) (MFA-ZV.H 386-8); Dep. Capital (Perichón) (MLP DB 1053-5, 1759-62, 3425, 3537, MFA-ZV.H 286); Dep. Itatí (MACN 31311-54); Dep. San Luis del Palmar (Esteros de Maloyas) (MFA-ZV.H 321-4).

Melanophryniscus devincenzi. **ARGENTINA, Misiones:** Dep. Candelaria (Prov. road 3, 3.5 Km from Nat. road 12, 27°29'26.5"S; 55°39'58.3"W) (MLP DB 753, 759, 802, 857, 876, 887, 889, 964, 1402-3); Dep. Candelaria (Puerto San Juan) (MLP DB 620-2, 1400-1); Dep. Capital (Parque Provincial Fachinal) (MACN 36856); Dep. San Pedro (MLP DB 1834). **URUGUAY, Rivera:** La Palma (Rubio Chico, close to Subida de Pena, Cuchilla Negra) (MNHN 1675 -Holotype).

Melanophryniscus dorsalis (Mertens, 1933). **BRAZIL, Santa Catarina:** Imbituba (Praia de Itapirubá) (MNRJ 27337-41); Santa Catarina (Laguna) (MCP 07660, MZUSP 71240-1); **Rio Grande do Sul:** Torres (MCP 233-44, 246-50, 252-265, 319-20, 6446-7, 6524-8, MNRJ 3022, 3037, 27342-4, 27346, MZUSP 102606-8).

Melanophryniscus fulvoguttatus (Mertens, 1937). **PARAGUAY, (MNRJ 5855); Alto Paraguay:** Puerto Primavera (FML 1868 - two specimens); Cororó (Río Ipané, 117 Km from Concepción, on road towards Padre Juan Caballero) (MACN 21654); San Pedro (Carumbé) (FML 1447-11, FML 1815 - four specimens); **Concepción:** Sapucaí (AL-MN 4735-6); Pavón (MNRJ 2666). **BRASIL, Mato Grosso do Sul:** Jardim (MNRJ 27347-8); Maracaju (MNRJ 4220-44, MZUSP 102330). **ARGENTINA, Formosa** (FML 02459).

Melanophryniscus klappenbachi Prigioni & Langone, 2000. **PARAGUAY, Alto Paraguay:** Casado (Ea. Casilda) (MACN 8212). **ARGENTINA, Chaco:** Dep. Almirante Brown (Los Frentones) (MACN 33947-76); Dep. Bermejo (Río de Oro, Gral. Vedia) (MACN (CENAI) 08731); Dep. 1º de Mayo (Río Tragadero) (MFA-ZV.H 413-4); Dep. San Fernando (Arroyo Palometa, Nat. Road 11) (MNHN 01496 - Holotype); **Santa Fe:** Dep. Melanophryniscus tumifrons. **BRAZIL, Rio Grande do Sul:** (BMNH 1947.2.1461 - Holotype).

The abbreviations (acronyms) for Institutions are as follows: British Museum Natural History, (BMNH), London, England; Centro Nacional de Investigaciones Iológicas (CENAI, now within MACN collection); Facultad de Ciencias, Universidad de La República (ZVC-B), Montevideo, Uruguay; Fundación Miguel Lillo, Instituto de Herpetología (FML), Tucumán, Argentina; Museo Argentino de Ciencias Naturales Bernardino Rivadavia (MACN), Buenos Aires, Argentina; Museo de La Plata (MLP), Buenos Aires, Argentina; Museo de Zoología, Universidad Nacional de Córdoba (MZUC), Córdoba, Argentina; Museo Florentino Ameghino (MFA-ZV.H), Santa Fe, Argentina; Museo Nacional de Historia Natural (MNHN), Montevideo, Uruguay; Museu de Ciências e Tecnologia of the Pontifícia Universidade Católica do Rio Grande do Sul (MCP), Porto Alegre, Brasil; Museu de Ciências Naturais da Fundação Zoobotânica do Rio Grande do Sul (MCN), Porto Alegre, Brasil; Museu Nacional (MNRJ), Rio de Janeiro, Brazil; Museu de Zoologia da Universidade de São Paulo, São Paulo, Brazil (MZUSP); Universidad Nacional de Misiones (CHUNAM) Posadas, Argentina.

Melanophrynniscus langonei sp. nov.

Fig. 1

Type-material. Holotype, adult ♀, URUGUAY, Rivera: Establecimiento Trinidad ($30^{\circ}59'S$, $55^{\circ}26'W$, approximately 230m elevation) 23.III.2001, R. Maneyro and D. E. Naya, cols. (ZVCB 5334). Paratypes, adult ♀, URUGUAY, Rivera: Establecimiento Vázquez ($31^{\circ}11'S$, $55^{\circ}21'W$, approximately 190m elevation) 12.IV.2001, D. E. Naya, cols. (ZVCB 6375); adult ♀, 07.VII.2001, D. E. Naya, cols. (ZVCB 8129); juvenile, approximately 230m elevation, 14.IX.2001, D. E. Naya, cols. (ZVCB 8336); adult ♀, 12.I.2002, D. E. Naya, cols. (ZVCB 9389).

Diagnosis. Small size, without swelling on snout, two paravertebral glandular ridges along the body from the end of the snout to the urostile, two discontinuous glandular ridges on both sides of the body, extending from the upper eyelid and scapular region to posterior end of body respectively, dorsal color of head and body light brown with glandular ridges darker, upper surfaces of appendages and upper eyelid dark brown, gular and pectoral zone uniformly black, belly black with large, reticulated orange-red spots.

Melanophrynniscus langonei is very similar to *M. sanmartini*. These two species can be distinguished as follows (characters of *M. sanmartini* in parentheses): dorsum with longitudinal glandular ridges (dorsum with rounded glandular warts scattered more abundantly in the head), dorsal color light brown with the glandular ridges darker (dorsal color dark brown with light brown spots), gular region black uniformly (gular region black with an ocher blotch just near tip).

The new species is distinguished from *M. moreirae* and from *M. stelzneri* group species (*M. stelzneri*, *M. montevidensis*, *M. atroluteus*, *M. dorsalis*, *M. fulvoguttatus*, *M. rubriventris*, *M. cupreuscapsularis*, *M. klappenbachi* and *M. krauczuki*) by dorsal coloration patterns and distribution of glandular warts. *Melanophrynniscus langonei* sp. nov. is easily distinguished from the members of the *M. tumifrons* group (*M. tumifrons*, *M. pachyrhynus*, *M. devincenzi*, *M. macrogranulosus*, *M. cambaraensis*, *M. orejasimirandai*, *M. simplex* and *M. spectabilis*) by the smaller size and absence of swelling on snout.

Description of Holotype. Body stout; head slightly broader than long ($HL/HW=0.90$) approximately one third of SVL; snout short, mucronated in dorsal view, slightly rounded in lateral profile; nostrils oval directed antero-laterally; eyes large, eye diameter smaller than interocular

distance and larger than eye-nostril distance, pupil horizontally elliptical; snout swelling absent; tympanic membrane absent; parotid gland absent; maxillae and premaxillae edentate; tongue short, narrow and elongate, posterior margin entirely rounded, free for about two thirds of length posteriorly; skin of dorsum scattered with glandular warts; each wart tipped with one white keratinized spine; vertebral line smooth, without glandular warts; two paravertebral glandular ridges along the body from the snout to the end of the urostile; two discontinuous glandular ridges on both sides of the body, extended from the upper eyelid and scapular region respectively to posterior end of body; upper eyelid with numerous warts; surface of forearms, hands and feet scattered with coni; skin of venter finely granular; lengths of fingers: IV < II < I < III; fingers blunt, short and slightly webbed; subarticular tubercles conical and well developed, divided on fingers I and III; inner metacarpal tubercle oval; outer metacarpal tubercle rounded, equal in size at the inner; palmar supernumerary tubercles conical and scattered; lengths of toes: I < II < V < III < IV; toes webbed; webbing formula I 1-1 II 1 $\frac{1}{2}$ -1 III 2-1 $\frac{1}{2}$ IV 1 $\frac{1}{2}$ -2 V; inner metatarsal tubercle oval; outer metatarsal tubercle rounded, one times smaller than inner; subarticular tubercles conical, divided on fingers I and IV; small supernumerary tubercles scattered in distribution.

Color in Life. Dorsal color of head and body light brown; longitudinal glandular ridges darker; vertebral line light brown; upper eyelid brown; loreal region light brown; upper surfaces of appendages and flanks brown; light brown stripe on upper arms; ventral head and pectoral zone uniformly black; belly black with mottled orange-red spots; an orange band on ventral surface of upper arms; posterior surfaces of thighs with a large orange-red spot; palmar surfaces of hands and fingers red; plantar surfaces of feet and toes V black, with red tubercles; ventral surface of toes I, II, III and IV red. In preservative (70% ethanol) red areas described above are whitish.

Measurements of Holotype (in mm). Snout-vent length (SVL) 21.29, head length (HL) 7.17, head width (HW) 7.99, eye diameter (ED) 2.19, interorbital distance (IOD) 2.78, eye-nostril distance (END) 1.93, internarial distance (IND) 1.82, upper eyelid width (UEW) 2.00, upper eyelid length (UEL) 3.36, thigh length (TL) 8.03, shank length (SL) 7.24, foot length (FL) 7.99, tarsus length (TAL)

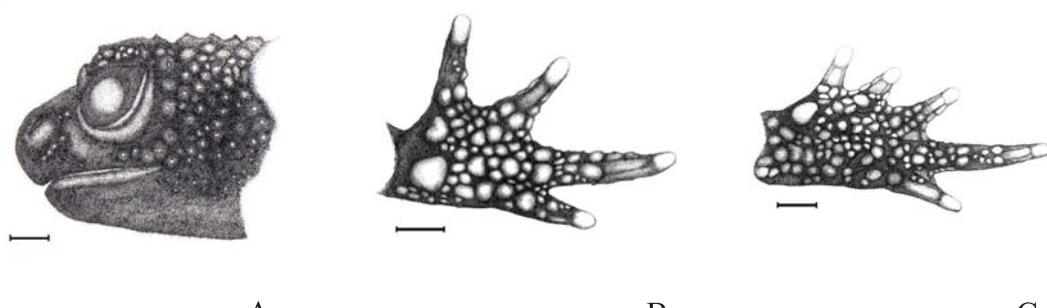

Fig. 1. Morphological features of *Melanophrynniscus langonei* sp. nov. (drawings based on the holotype, ZVCB 5334). (A, head in lateral view. B, left hand in ventral view. C, left foot in ventral view). Scale bar, 1mm.

Fig. 2. Type locality of *Melanophrynniscus langonei* sp. nov. In the photo one of the drift fences can be seen among the *Pinus* crops.

5.55, upper arm length (UAL) 5.04, forearm length (FAL) 5.2, hand length (HAL) 5.71.

Variation. The range of measurements (in millimeters) of adult paratypes are (N=3, average given in parenthesis): SVL 20.49-21.52 (21.01), HL 6.89-7.41 (7.15), HW 6.92-7.02 (6.97), ED 2.10-2.15 (2.13), IOD 2.47-2.61 (2.54), END 1.71-1.76 (1.74), IND 1.48-1.70 (1.59), UEW 1.86-2.08 (1.97), UEL 3.09-3.20 (3.15), TL 7.53-8.27 (7.9), SL 6.06-7.34 (6.7), FL 6.68-7.73 (7.21), TAL 4.77-5.48 (5.13), UAL 5.05-5.34 (5.20), FAL 4.79-4.92 (4.86), HAL 5.41-6.04 (5.73). There is know only one juvenile specimen (12.9mm in SVL), which has the same external characteristics of the adults.

Advertisement Call, Tadpoles and Karyotype. Unknown.

Etymology. The specific name is in honor of Lic. José Langone, Uruguayan herpetologist, who has developed studies on South American amphibians, especially about the *Melanophrynniscus* genus.

Distribution and Natural History. *Melanophrynniscus langonei* is only known from two localities separated by about 15Km in the Departament of Rivera, northern Uruguay. This is a soft hilly area; with an open landscape and predominance of grasslands; surrounded by small streams; and currently modified by *Eucaliptus* sp. (Myrtaceae) and *Pinus* sp. (Pinaceae) plantations (Fig. 2). In these two places, specimens of *M. sanmartini* Klappenbach, 1968 were also collected (NAYA & MANEYRO, 2000). Although, specimens of *M. langonei* were found in all seasons of the year, their frequency of capture (about 1/1000 individuals) was the lowest of the 23 anuran species collected in the study area. Some circumstantial reproductive evidence, as the presence of mature ovules in May (ZVCB 6375) and the collection of a juvenile in September, could indicate that reproduction in *M. langonei* takes place during winter.

Acknowledgments. To Compañía Forestal Uruguaya (COFUSA) for economic support to the research program. To

Dr. W. Ronald Heyer for critical review of the manuscript. R. M. has a doctoral fellowship from Coordenação de Aperfeiçoamento de Pessoal de Nível Superior (CAPES) at PUCRS. D. E. N. acknowledges financial support from PEDECIBA (Uruguay), CASEB (Fondecyt, Chile), and CONICYT (Chile). We are grateful to R. Stetson (CHUNAM), S. Kretzschmar, M. Cénepea, and E. Lavilla (FML), G. Carrizo (MACN), M. Di-Bernardo (MCP), M. Borges Martins (MCN), C. Virasoro and E. Fioramonti (MFA), J. Williams (MLP), J. Langone (MNHN), U. Caramaschi and C. A. G. Cruz (MNRJ), H. Zaher (MZUSP), for providing working space at their respective institutions. We thank M. Ledesma for producing the drawings.
