Abstract
Ecballium elaterium species are mostly used as therapeutic agents and food ingredient. The current work was designed to investigate phytochemical contents, antioxidant, antibacterial, and anti-inflammatory properties of methanol fruits extract of Ecballium elaterium. Good antioxidant activity was observed with IC₅₀ values of 156 ± 4 and 377 ± 6 μg/mL for DPPH and ABTS, respectively, and EC₅₀ of 126 ± 4 μg/mL for FRAP assays, which is related with their richness in total phenolic, flavonoid and condensed tannins contents. The results of antibacterial activity showed the effectiveness of methanol extract against Bacillus cereus with value of inhibition zone diameter of 15 ± 0 mm and a MIC and MBC values of 6 ± 0 and 12 ± 0 mg/mL, respectively. The in vivo anti-inflammatory effects have been also studied by carrageenan induced rat paw edema assay and the results revealed that a dose of 75 mg/kg induced a significant inhibition of 66.4% at 2 h. FT-IR spectral data justified the presence of biological functional groups such as –OH, C–H, C=O, C–C and C=O. These results highlighted the potential using of Ecballium elaterium fruits extract as natural antimicrobial, antioxidant and anti-inflammatory agents for food applications and for the pharmaceutical industry.

Keywords: Ecballium elaterium methanol fruits extract; phytochemical contents; FT-IR analysis; in vitro antioxidant and antibacterial behavior; in vivo anti-inflammatory potential.

Practical Application: Ecballium elaterium is a medicinal plant which possess wide spectrum of different biological activities.

1 Introduction

Nowadays, increasing in prevalence of multiple drug resistance implies the development of new synthetic antibacterial, antioxidative and anti-inflammatory drugs from alternative sources (Papadopoulos et al., 2005). Therefore, there is a renewed interest in natural substances containing phytoconstituents that exhibited several biological properties. They are used in health to prevent oxidative deterioration and some chronic diseases (Tel-Çayan et al., 2015). The development of phagocytes and the production of non-free radicals (H₂O₂) and radicals of O₂ and OH species induced many inflammatory disorders which caused many chronic diseases (Zeng et al., 2017). Medicinal plant therapy was well known for their richness in anti-inflammatory substances. In fact, herbal extracts and their major phytochemical compounds possess a good anti-inflammatory potential (Lee et al., 2011).

Ecballium elaterium (Cucurbitaceae) is known as a squirting cucumber, perennial herb that is largely abundant in Mediterranean region. Traditionally, this plant has been used for the treatment of fever, cancer, sinusitis, jaundice, constipation, hypertension and rhinosinusitis (Mazokopakis et al., 2009). The fruit juice was known for its antipyretic and analgesic potential. The roots and fruits extracts of this plant has been used as a curative. In Tunisia, the plant is widely consumed as infusion and used for the treatment of sinusitis and rheumatic (Bizid et al., 2014).

This work was designed to evaluate the total phenolic, flavonoid, and condensed tannin of methanol extract of E. elaterium fruits as well as the identification by FT-IR of the main active functional groups, and to evaluate its in vitro antioxidant and antibacterial properties. It also aimed to determine for the first time the in vivo anti-inflammatory activity of methanol extract by carrageenan induced rat paw edema assay with histopathological and biochemical analysis.

2 Materials and methods
2.1 Plant collection and preparation of extract

The fruits of E. elaterium (L.) were collected in May 2015 from plants grown in the Sidi Bouzid province of Tunisia (latitude 35°02′17″, longitude 9°29′05″; elevation: 332 m). After collection, the preparation of extract followed the same method as done by Yilmaz et al. (2017).
2.2 Total phenolic, total flavonoid, and tannin contents

The phytochemical contents of methanol fruits extract were investigated according to the same protocol done by Mrabti et al. (2017). Tannin contents of extract were determined by the same test as used by Sun et al. (1998). Each test was performed thrice.

2.3 Fourier Transform Infrared Spectroscopy (FT-IR)

The FT-IR spectra of methanol fruits extract were recorded with at room temperature on a Universal ATR Sampling Accessory infrared spectrophotometer. Dried paste of extract was loaded on the sample chamber of FT-IR spectrophotometer and scanned with a scan range from 550 to 4000 cm\(^{-1}\) at a resolution of 4 cm\(^{-1}\).

2.4 Antioxidant activities

**DPPH and FRAP assays**

Measurements followed the same method as done by Amessis-Ouchemoukh et al. (2017).

**ABTS test**

In this assay we followed the same protocol as described by Re et al. (1999). Trolox was used as our reference.

2.5 Screening of antibacterial activity

The antibacterial activity of extract was tested against Gram positive bacteria Bacillus subtilis JN 934392, Bacillus cereus JN 934390, Staphylococcus aureus ATCC 6538 and Gram negative bacteria Escherichia coli ATCC 25922, Salmonella enteritidis, and Klebsiella pneumoniae. The determination of the inhibition zone diameter, minimum inhibitory concentration (MIC), and minimum bactericidal concentration (MBC) were based on the same method used by Mzid et al. (2017).

2.6 In vivo anti-inflammatory activity

**Carrageenan-induced acute inflammatory model**

Anti-inflammatory activity was measured using carrageenan induced rat paw edema assay as ascribed by Olajide et al. (2000) and Owoyele et al. (2004).

Biochemical evaluation and histopathological analysis

The biochemical and histopathological evaluation has been done using the same protocol of Saoudi & El Feki (2012) and (Sadeghi et al., 2011), respectively.

2.7 Statistical analysis

The results were analyzed by SPSS, ANOVA variance and Tukey test for multiple comparisons. Differences were considered statistically significant at \(p < 0.05\).

3 Results and discussion

3.1 Phytochemical contents

The results indicated that phenolic, flavonoid and condensed tannin contents in methanol extract were found to be 93 ± 2 mg GAE/g, 7 ± 1 mg QE/g and 1 ± 0 mg CE/g, respectively. These phytochemicals play a versatile role in curing many diseases. Therefore, we attempted to estimate the biological active functional groups in methanol E. elaterium extract of by FT-IR method.

3.2 FT-IR spectral analysis of methanol extract

FT-IR spectral analysis data for the methanol extract (Figure 1) revealed the existence of multiple biological active functional groups. For the higher wavenumbers, the absorption band at 3350.4 cm\(^{-1}\) was attributed to —OH stretching vibration specific of phenolic compounds which indicate hydroxyl groups exist in extract, while the peaks at 2924.3 and 2850.7 cm\(^{-1}\) were due to CH\(_2\) anti-symmetric stretch of methyl groups mainly from lipids. The absorption peaks around 1746.1 and 1635.1 cm\(^{-1}\) are assigned to the stretching vibration of carbonyl group and to ring C—C stretch of phenyl, respectively. The presence of peak at 1372.66 cm\(^{-1}\) respectively, is due to the in-plane C—O stretching vibration combined with the ring stretch of phenyl. Between 1200 and 1050 cm\(^{-1}\), one can observe a stretching absorption band of C—O for phenols. The "shoulder" peak at 1160.0 cm\(^{-1}\) is from carbohydrate, whereas the absorptions bands at 1055.4 and 984.0 cm\(^{-1}\) are derived from the vibrational frequency of the CH\(_2\)OH groups of carbohydrates.

### Figure 1. FT-IR spectra of methanol fruits extract of E. elaterium.
the existence of free OH groups that act as donating hydrogen and therefore to remove the extra electron (Lobo et al., 2010).

ABTS radical scavenging assay: ABTS method is widely used to estimate antioxidant activity in foods and biological systems. The scavenging ability of methanol fruits extract of *E. elaterium* was expressed in terms of percentage of inhibition and IC$_{50}$ values (Table 1). The results were dose dependent manner and statistically significant ($p < 0.05$).

The scavenging ability of ABTS$^+$ could presumably related to the richness of extract in phenolics compounds, which can act as electron donors by reacting with free radicals. Hagerman et al. (1998) reported that tannins are powerful compounds for soaking free radicals (ABTS$^+$). Higher scavenging antiradical effect with ABTS method may be due to the higher contents of polyphenolics in this extract.

Ferric reducing power: As depicted in Table 1, reducing capacity of the same extract significantly ($p < 0.05$) increased with increasing in concentration (50-400 µg/mL). The obtained results suggest that *E. elaterium* may have important applications in the future as a good source of natural antioxidants for plant-based food products.

### 3.4 Antibacterial activity

The results depicted in Table 2 showed that methanol fruit extract were more effective against *Bacillus cereus* with an inhibition zone diameter of 15 ± 0 mm, MIC of 6 ± 0 mg/mL, and MBC of 12 ± 0 mg/mL. In the same way, the extract showed an interesting activity against *S. enteritidis* with inhibition zone diameter, MIC, and MBC values of 12 ± 0 mm, 12 ± 0 and 25 ± 0 mg/mL, respectively. While the other bacteria showed moderate sensitivity toward the tested extract with inhibition zone diameter ranging from 8 ± 1 to 9 ± 1 mm.

Sasmakov et al. (2012) study justified that methanol extract of *E. elaterium* had weaker activity against *S. aureus* (ATCC 29213) with inhibition zone diameter of 8 ± 0 mm, and negative activity against *B. subtilis* (ATCC 6059) and *E. coli* (ATCC 25922), these results are different to our study. In agreement with the report of Chamandi et al. (2015), an extract is bacteriostatic.

Data are mean ± standard deviation of three individual determinations. (−): Not detected.
when MBC/MIC ≥ 4 and bactericidal if MBC/MIC ≤ 4. Based on this study, it can be concluded that methanol extract of *E. elaterium* have a bacteriostatic and bactericidal effect on Gram-positive and Gram-negative, respectively. The differential sensitivity of Gram-positive and Gram-negative bacteria to plant extract may be explained by the morphological differences between the microorganisms. In this study, the Gram-negative isolates were less susceptible to the plant extracts than the Gram-positive bacterial isolates. In fact, the strongly resistance of Gram-negative bacteria was accredited to the complexity of the double membrane including cell envelope, that be expressed by lipoprotein and lipopolysaccharide, and which plays the role of a barrier to the antibacterial substances, contrasted to the single membrane structure of Gram-positive bacteria. A shown, antibacterial behavior may be related to the richness of this extract in bioactive components. This superior antibacterial property may be related to the higher contents of polyphenolics in this extract. Our results clearly demonstrate the possibility to use *E. elaterium* fruits as a source of new antibacterial agents of multiple-barrier food preservation systems.

### 3.5 Anti-inflammatory studies

The results showed that pre-treatment of rats with the extract (75 mg/kg) showed significantly reduced paw edema from 1 h until 5 h (Figure 2 and Table 3). The highest inhibition of edema obtained by the extract with 75 mg/kg dose was 66.4% at 2 h. The extract compared effectively with standard drug indomethacin (10 mg/kg) used in this study, which produced a peak inhibition of edema (72.6%) at 2 h.

Our results showed that the methanol fruits extract of *E. elaterium* exerted higher anti-inflammatory potential. The extract also inhibited the inflammatory processes of intraperitoneal injection administration at low dose. Herbals can to synthesize a large variety of chemical compounds with beneficial effects on health. It has been reported that certain flavonoids have an inhibitory effect against histamine release in mast cells (Weng et al., 2012). By their anti-inflammatory potential, flavonoids can interact directly with the prostaglandins system like the non-steroidal anti-inflammatory drugs (Aro et al., 2016). So, this activity was correlated to the richness of this extract in flavonoids and tannins and therefore, justified clearly that *E. elaterium* fruits may be used for the treatment of chronic inflammation.

**Biochemical evaluation:** The administration of carrageenan in rats induced a significantly increase in AST, ALT, ALP, Ferritine and CK levels as compared to control vehicle rats. The methanol fruits extract of *E. elaterium* and indomethacin reduced significantly the elevated levels of serum AST, ALT, ALP, Ferritine and CK as compared to untreated rats and carrageenan rats alone (Table 4). The above results are consistent with the reports of Sengar et al. (2015) which verified that AST, ALT and ALP enzymes were enhanced in both acute and sub-chronic inflammation. Sengar et al. (2015) confirmed that extract of *Jasminum sambac* at 400 mg/kg (p.o) considerably restored the AST and ALT level but without alteration in ALP level.

Phytochemical analysis and biological activities of Ecballium elaterium methanol fruits extract

Histopathological findings: Histological investigation was examined by hematoxylin and eosin staining. High infiltration damage due to accumulation of infiltrating inflammatory cells was observed for Group B. However, the vehicle control Group A was devoid in inflammation and the infiltration damage was moderated in the methanol fruits extract of E. elaterium and indomethacin drug treatment groups compared to high level of infiltrating inflammatory cells in Group B (Figure 3). Similar studies were conducted previously by Maleki et al. (2001) which demonstrated the protective effects of the hydroalcoholic extract of Stachys inflata aerial parts of against carrageenan induced histopathological paw tissue and the results found in this study also support the facts. These findings provide the potential use of E. elaterium as a good source of anti-inflammatory agents, or food supplement for prevention of chronic diseases.

4 Conclusions

The results suggest that E. elaterium fruits extract contain a wide range of phenolics, flavonoids and condensed tannins contents, associated with potent pharmacological activities. From this study it can be suggested that the tested E. elaterium fruits extract have potential antioxidant behavior. The results show also that the extract exhibited a higher antibacterial activity which can be used as a potent antibacterial agent against Bacillus cereus. Besides, the extract was found to possess considerable anti-inflammatory properties at dose tested, and could have significant effect against chronic inflammation. We confirmed in this study the useful of E. elaterium as a promising plant for food industry. The methanol fruits extract of E. elaterium needed more investigation in order to identify the major active compounds and to demonstrate their mode of action.
