Perception of Physical Therapy students about their training to work for the Brazilian Unified Health System

ABSTRACT | The implementation of the Unified Health System in Brazil (Sistema Único de Saúde – SUS) and the search for its principles have led to changes in health practices, promoting alterations in the formation and development processes of the professionals of the field. In this context, this study aims to determine the perception of Physical Therapy students from a Higher Education Institution in the city of Teresina, Piauí, Brazil, on their training to provide services for SUS, by means of the application of a questionnaire specifically designed for this study. The research sample was composed of 42 out of the 54 students of Physical Therapy enrolled from the 6th to the 10th periods, which is also the last period of the course. The results show that 81% of academicians reported knowing something about SUS because of higher education institution. It was observed that only members of the sample attending the 10th period (28.6%) were interns in the public health system and community physical therapy. It was found that 91.7% of students from the 10th period and 43.3% of the students representing the other periods judged themselves to be able to work with the system. Thus, it appears that most interviewed students are aware of SUS, because of graduation, and believe to be prepared to work with the system, especially after the supervised internship.

Keywords | human resources formation; physical therapy; primary health care; Sistema Único de Saúde.
INTRODUCTION

The struggles of Brazilian social and sanitary movements were responsible for the creation of the Unified Health System (Sistema Único de Saúde – SUS), which changed management processes, social participation and the conception of health. Basic principles emerge from SUS, such as universality, equity and resoluteness, and the actions and services related to health must be developed according to these principles and guidelines from Article 198 in the Federal Constitution: decentralization, full attention to health and social participation1-3.

The implantation of SUS and the search for its principles have raised several elaborations and propositions concerning the adopted care models, the financing logic and professional practices. Regarding professional work, there is increasing debate about the need to adjust the formation of professionals in relation to the new logic of organization in health services based on the principles and guidelines of SUS4.

For a long time, the graduate teaching in Brazil has been characterized by the acquisition of technical and scientific knowledge coming from inarticulate disciplines that do not integrate theory and practice. Such teaching models are not able to provide professional formation that builds the necessary profile to work in the perspective of full attention to health, including actions of promotion, protection, prevention, early attention, cure and rehabilitation5,6.

In this context, one of the courses in the health field that goes through this change process in order to graduate professionals that are skilled to work with SUS is the Physical Therapy one. Since the profession appeared, with the goal of treating people with physical injuries caused by wars, Physical Therapy has had an essentially curative and rehabilitative character. For a long time, this point of view excluded Physical Therapy services from the public system, so the population had great difficulty to access such services7,8.

The National Curriculum Guidelines for the graduation in Physical Therapy point out that “the formation of the physical therapist should contemplate social health needs, with emphasis on SUS”. The latter should not be taken for basic attention. Its role is to provide attention to health and integrate interventions concerning health promotion, protection and recovery, however, the first level of attention is the entrance door to the system, so there should be great resoluteness, of approximately 90%, thus becoming a priority2,7,9.

With this premise, and considering that SUS is a major employer of health workers, it is important to pay attention to the formation of Physical Therapy professionals. Such formation should stimulate critical and productive thinking, being based on the problems of the assisted population and valuing the knowledge that is daily produced in health units, articulating it with the content coming from university. Professionals with such formation who know the Brazilian health system and health policies are usually committed to this system, which is important in order to be effectively engaged in proposals to transform professional practices and the organization of the work10.

In this context of changes concerning the Physical Therapy graduation, this study aimed to analyze the perception of Physical Therapy students from a public higher education institution in Teresina, Piauí, about their formation to provide services to SUS, in order to know how students, who are the main actors in this process, see their formation in relation to SUS, as well as their expectations and knowledge regarding the Brazilian health system.
METHODOLOGY

It is a cross-sectional, quantitative and descriptive study, and the subjects were Physical Therapy students from the Center of Health Sciences at *Universidade Estadual do Piauí* (CCS/UESPI), located in the city of Teresina (PI).

The Physical Therapy course of this higher education institution counts on a workload of 5,220 hours/class, and 1,440 hours/class consist of supervised internship. The program is constituted of theoretical disciplines that approach collective health in the 4th period, which are public health and community physical therapy. These add up to 120 hours/class, and all of the students analyzed in the study had already taken these disciplines. Supervised internships occur in the last year of the course, being divided into outpatient clinics and public health in the 9th period, and hospitals in the 10th period.

Due to the theoretical disciplines and the practical experience with SUS in the supervised internship, which enable the student to assist in basic attention, and according to resolution 139/92 of the Federal Council of Physiotherapy and Occupational Therapy (COFITO), art. 7, item II, Physical Therapy internships can only take place “after the 6th graduation period for being part of the professionalizing subjects”\(^{11}\). The 9th period did not have students regularly enrolled in the institution, so it was excluded from the study. Therefore, all of the students regularly enrolled in the 6th, 7th, 8th and 10th periods of the Physical Therapy course of CCS/UESPI were included in the study, regardless of gender and aged 18 years old or more. Those who were not in the classroom at the time of data collection were excluded.

To meet resolution 196/96 of the National Health Council, the research was approved by the Research Ethics Committee of *Universidade Estadual do Piauí* (UESPI), being approved and registered (n. 059/11). Participants signed two copies of the informed consent form, being one for themselves and the other for the researcher in charge. Besides, researchers took all of the precautions so that confidentiality, privacy and autonomy of the subjects could be preserved.

Data collection was performed by a questionnaire comprised of 14 questions, with open and closed items, elaborated by the authors, who included four questions on demographic data of the interviewees, two questions about the expectations in relation to SUS such as work market, seven questions about the appropriation of academic, theoretical and practical knowledge regarding SUS as to the skills to work with basic attention, and one question about the contribution of the Physical Therapy course in this context.

Subjects were recruited in the classroom and in the internship by verbal invitation. After the explanation about the research and the authorization of the professor, questionnaires were immediately answered and given to the researcher.

The software Epi Info, version 3.5.3, was used for the statistical evaluation of the collected data, by distributing frequencies, percentages, central tendency measures and dispersion.

RESULTS

Out of the 54 students enrolled from the 6th to the 10th period in the Physical Therapy course from the analyzed institution, 42 of them answered the questionnaire, corresponding to 80.8% of the universe of the research. The sample was sufficient, considering a margin of error of 10%, 95% confidence level and 50% level of heterogeneity.

The age of the interviewed students ranged from 18 to 28 years old, with mean of 22.2 years (±1.8). The female gender was predominant in the sample, with 30 interviewees (71.4%).

Graph 1 expresses the choice of the interviewees between the public and the private services for their professional practice after graduation.

When questioned about the higher education institution providing knowledge concerning SUS, 34 of them (81%) reported having received information of this type during their academic life.
Students answered two questions related to SUS, which assessed knowledge as to some principles of the system, expressed in Table 1.

All of the students stated that the community has something to teach the Physical Therapy student.

Table 2 shows the experience of students with the Unified Health System in a public hospital, and their experience in the basic attention and in collective health and community physical therapy internships.

When questioned about feeling prepared to work in SUS, results are demonstrated in Graph 2.

The reasons reported by the students from the 6th to the 8th period that revealed inaptitude to work in SUS were lack of experience and insufficient knowledge. At the same time, students in the 10th period reported lack of experience.

**DISCUSSION**

The creation of SUS led to changes in health practices, imposing alterations to the process of formation and development of professionals in the field. As institutions that are essential to this process, universities should be focused on problem solving and social needs with special responsibility towards the production of new knowledge and the formation of critical and socially committed professionals. In this context, the formation of a physical therapist should not be based on specialties, but on health policies.\textsuperscript{12-14}

Some steps have been taken to form a professional profile that can meet the needs of SUS with resoluteness and quality. An initiative was the reformulation of the National Curriculum Guidelines, integrating work and teaching, practice and theory, teaching and community. Another step was the integration of public service as a practice field for teaching and research by means of visits, internships or extension projects, recognized in article 27, Law 8080/80.\textsuperscript{12,15}

SUS institutionalizes health services in Brazil, being considered as the largest health work market in the country.\textsuperscript{12} According to Oliveira\textsuperscript{16}, the increasing positions offered in public exams, the quality of the positions, the nondiscrimination by sex, age or experience, turns this sector into a great alternative for many young people who have just left college. In the research, it was observed that 19% of the students wish to work exclusively in the public sector, and 78.6% wish to work both in the public and the private services. A similar result was found by Pinheiro et al.\textsuperscript{6}, once 87.5% of the students revealed the desire to work for both sectors.

Students showed domain in theoretical questions related to social participation, and, especially, to the location of actions and procedures developed by SUS. A similar study was conducted with Physical Therapy students of Universidade de Fortaleza (CE), which also showed the good performance of students as to theoretical preparation for questions concerning origin, popular participation, doctrinaire and organizational principles of SUS.\textsuperscript{6}

This situation is explained by the analysis of the program of the Physical Therapy course, which consists of theoretical disciplines that approach the matter of collective health, public health and community physical therapy in the 4th period, and all of the students who participated in this study had already taken such disciplines.
In a study with students from the higher educational institution in João Pessoa (PA), Pimentel\textsuperscript{17} observed that, in the levels of attention to health, Physical Therapy students are less prepared for the primary level (16%), while the secondary level had the greatest expression among the answers of the students (45.46%).

As a way to keep Physical Therapy away from the paradigm of being merely a rehabilitating profession, education should be based on community, which enables the development and training of skills and abilities such as leadership, work in a multidisciplinary team, interaction with the community, problem solving, communication and planning, therefore looking for care integrity and the real and effective implantation of the principles of SUS. Thus, the domain of technical knowledge is undoubtedly indispensable, however, not enough for the model that we are trying to build. The practical learning fields are essential in this aspect. Corroborating this idea, all of the analyzed students believe that the community has something to teach to the student\textsuperscript{13,18}.

As seen in Table 2, the fields of internship in hospital environments were predominant, and this field was inserted since the 6\textsuperscript{th} period of graduation. Silva and Ros\textsuperscript{19}, Gallo\textsuperscript{7} and Ferreira, Silva and Aguer\textsuperscript{20} found a similar situation in their studies. So, they stated that the centralization of internships in hospitals and outpatient clinics makes it difficult to stimulate a broader formation, one that is more general and humanist. This demonstrates that teaching is focused on the curative and rehabilitating aspect of Physical Therapy, with little attention to the primary level.

The study found a lower proportion of students who stated having undertaken an internship in basic attention before the Mandatory Supervised Internship (Table 2), all of them from the 10\textsuperscript{th} period. This information is explained because the institution and its guidelines restrict the supervised internships to the last year of course, being divided into outpatient clinic and public health in the 9\textsuperscript{th} period, and hospitals in the 10\textsuperscript{th} period. This fact reports and justifies the findings of this study, in which outpatient and hospital formation takes place in public institutions, school hospitals that only care for users of SUS.

The late experience of students in the course observed in this study, with practices in collective health and community physical therapy, which refer to the practice of SUS in basic attention and the exercise of Physical Therapy, is in accordance with the study by Silva\textsuperscript{19}, performed with Physical Therapy students from Universidade do Sul de Santa Catarina, who reported having had contact with the field of collective health only in the last year of graduation, and, in the theoretical field, they reported having isolated disciplines in the beginning of the course related to collective health addressed to SUS and basic attention to health.

Concerning the perception of the students as to their formation to work with SUS, the students in the last year of course considered they were skilled for the job, while 56.7% of the students from the 6\textsuperscript{th} to the 8\textsuperscript{th} period revealed inaptitude for such work. The reported motives were lack of experience and insufficient knowledge, which reveals that more effort is required so that the disciplines can arrange the adaptation of students to the principles and guidelines of the current health system. The analyzed institution presents isolated disciplines in the beginning of the course, without a practical relationship with the community, which only takes place in the last year of graduation, with the supervised internship, which accounts for 1,440 hours/class and only 72 hours/class approach the subject of basic attention with internship in community physical therapy.

Barbosa et al.\textsuperscript{13} found critical points described by the Physical Therapy professionals in their functions in basic attention, in teams of Núcleo de Apoio à Saúde da Família (NASF), among which the care and clinical formation have been mentioned as obstacles for them to adapt to the proposals of SUS, making them more dependent on technologies to work.

Facing these facts, the importance of the pedagogical formation based on the principles and guidelines of SUS is emphasized, due to its importance in the health scenery in the country, in order to operate changes in the service to be provided. It is important to develop the promotion of events involving the higher education institution (professors and students) with the community, from the beginning of the course, promoting a broader view and including Physical Therapy in the field of basic attention, besides its rehabilitating function, thus emphasizing the principle of integrity of health practices, such as collective effort, speeches and courses.

**CONCLUSION**

In this study, it was observed that most students aim the public service as a field for professional performance. The study showed a high percentage of right answers in theoretical questions involving SUS, and
that the analyzed institution does not focus on the practice of basic care in periods prior to the supervised internship. This practice only takes place in supervised internships, which shows that only students from the last period, mostly, prove to be able to work with basic care, therefore, to SUS. The suggestion is that managers and professors of this institution have greater commitment to the practice of basic care in the initial periods of the course.
