Supplementary Material to “Multiple genes contribute to anhydrobiosis (tolerance to extreme desiccation) in the nematode Panagrolaimus superbus”

**Figure S2** - Gel densitometry. Worms were soaked in solutions containing 1 µM of siRNA against GFP (siGFP, the control group) or against the *ifb-1* gene (si-ifb1). Left: total RNA was extracted and RT-PCR was performed to amplify target gene (*ifb-1*, the thinner band) and the endogenous control (*β-actin*). Right: gel densitometry using the software ImageJ.
