General Information

$^1$H and $^{13}$C nuclear magnetic resonance (NMR) spectra were recorded at 400 MHz on a Bruker ARX-400 NMR spectrometer (Germany) with tetramethylsilane as internal standard. Column chromatography was performed using Merck (Germany) silica gel (230-400 mesh). Thin layer chromatography (TLC) was performed using Merck silica gel GF254, 0.25 mm thickness. For visualization, TLC plates were placed under acidic vanillin. All solvents were used in dry conditions. $^1$H and $^{13}$C NMR spectral data of the compounds are identical to previous works.1-5

General procedure for the synthesis of allyl/alkynyl glycoside (3a-h)

To a suspension of the respective sugar (1 mmol) and FeCl$_3$ (0.1 mmol) in dry dichloromethane (1 mL), the allyl/alkynyl alcohol (1.2 mmol) was added slowly. The reaction mixture was allowed to stir for 8 h at room temperature under inert atmosphere. After completion of the reaction (monitored by TLC), 10 mL dichloromethane were added and washed with water, brine and dried over Na$_2$SO$_4$ and evaporated to leave the crude product. Purification by column chromatography over silica gel (hexane/ethyl acetate 1:1) furnished the pure corresponding products.
