Introduction

During the second half of the twentieth century, nonisothermal problems of the theory of elasticity became increasingly important. This is due to their widespread application in diverse fields. The high velocities of modern aircraft give rise to aerodynamic heating, which produces intense thermal stresses that reduce the strength of the aircraft structure.

Nowacki (1957) has determined steady-state thermal stresses in a thick circular plate subjected to an axisymmetric temperature distribution on the upper face with zero temperature on the lower face and the circular edge. Roy Choudhary (1972) (1973) and Wankhede (1982) determined Quasi-static thermal stresses in thick circular plate. Gogulwar and Deshmukh (2005) determined thermal stresses in thick circular plate with heat sources. Also Tikhe and Deshmukh (2005) studied transient thermoelastic deformation in a thin circular plate, where as Qian and Batra (2004) studied transient thermoelastic deformation of thick functionally graded plate. Moreover, Sharma et al (2004) studied the behavior of thermoelastic thick plate under lateral loads and obtained the results for radial and axial displacements and temperature change have been computed numerically and illustrated graphically for different theories of generalized thermoelasticity. Also Nasser M.EI-Maghray (2004) (2005) solved two-dimensional problem of thick plate with heat sources in generalized thermoelasticity. Recently Ruhí et al (2005) did thermoelastic analysis of thick walled finite length cylinders of functionally graded materials and obtained the results for stress, strain and displacement components through the thickness and along the length are presented due to uniform internal pressure and thermal loading.

The present paper deals with the determination of thermal stresses in a thick circular plate under steady temperature field. A thick circular plate is considered having constant initial temperature and arbitrary heat flux is applied on the upper face with lower face at initial temperature and the fixed circular edge is thermally insulated. Heat is exchanged through heat transfer at lower boundary surface. The results are obtained in series form in terms of Bessel’s functions and they are illustrated numerically.

Keywords: quasi-static, steady state, thermoelastic problem, thermal stresses

Formulation of the Problem

Consider a thick circular plate of radius \( a \) and thickness \( h \) defined by \( 0 \leq r \leq a, -h/2 \leq z \leq h/2 \). The initial temperature in a thick circular plate is given by constant \( T_i \). The heat flux \(-Q_i(r)/k\) is applied on the upper surface of plate \( (z = h/2) \) and lower face \( (z = -h/2) \) is at initial temperature \( T_i \). The fixed circular edge \( (r = a) \) is thermally insulated. Under these more realistic prescribed conditions, the steady state thermal stresses are required to be determined.

The differential equation governing the displacement potential function \( \phi(r, z) \) is given in Noda et al (2003) as

\[
\frac{\partial^2 \phi}{\partial r^2} + \frac{1}{r} \frac{\partial \phi}{\partial r} + \frac{\partial^2 \phi}{\partial z^2} = K \tau
\]

(1)

where \( K \) is the restraint coefficient and temperature change \( \tau = T - T_i, T_i \) is initial temperature. Displacement function \( \phi \) is known as Goodier’s thermoelastic displacement potential.

The steady state temperature of the plate satisfies the heat conduction equation,

\[
\frac{\partial^2 T}{\partial r^2} + \frac{1}{r} \frac{\partial T}{\partial r} + \frac{\partial^2 T}{\partial z^2} = 0
\]

(2)

with the boundary conditions

\[
\lambda \frac{\partial T}{\partial z} = -Q_i(r) \quad \text{at} \quad z = h/2, 0 \leq r \leq a
\]

(3)

\[
T = T_i \quad \text{at} \quad z = -h/2, 0 \leq r \leq a
\]

(4)

\[
\frac{\partial T}{\partial r} = 0 \quad \text{at} \quad r = a, -h/2 \leq z \leq h/2
\]

(5)

and

\[
T = T_i \quad \text{at} \quad t = 0
\]

(6)

The displacement function in the cylindrical coordinate system is represented by the Michell’s function defined in Noda et al (2003) as

The present paper deals with the determination of thermal stresses in a thick circular plate under steady temperature field. A thick circular plate is considered having constant initial temperature and arbitrary heat flux is applied on the upper face with lower face at initial temperature and the fixed circular edge is thermally insulated. Heat is exchanged through heat transfer at lower boundary surface. The results are obtained in series form in terms of Bessel’s functions and they are illustrated numerically.
Quasi-Static Thermal Stresses in ...

\[ u_r = \frac{\partial \phi}{\partial r} - \frac{\partial^2 M}{\partial rdz} \]
\[ u_z = \frac{\partial \phi}{\partial z} + 2(1-\nu)\nabla^2 M - \frac{\partial^2 M}{\partial z^2} \]

The Michell’s function \( M \) must satisfy

\[ \nabla^2 \nabla^2 M = 0 \]

where

\[ \nabla^2 = \frac{\partial^2}{\partial r^2} + \frac{1}{r} \frac{\partial}{\partial r} + \frac{\partial^2}{\partial z^2} \]

The component of the stresses are represented by the thermoelastic displacement potential \( \phi \) and Michell’s function \( M \) as

\[ \sigma_{rr} = 2G \left[ \frac{\partial^2 \phi}{\partial r^2} - K \tau + \frac{\partial}{\partial z} \left( \nu \nabla^2 M - \frac{\partial^2 M}{\partial r^2} \right) \right] \]

\[ \sigma_{\theta\theta} = 2G \left[ \frac{1}{r} \frac{\partial}{\partial r} \nu \nabla^2 M - \frac{\partial M}{\partial r} \right] \]

\[ \sigma_{zz} = 2G \left[ \frac{\partial^2 \phi}{\partial z^2} - K \tau + \frac{\partial}{\partial z} \left( 2-\nu \nabla^2 M - \frac{\partial^2 M}{\partial z^2} \right) \right] \]

and

\[ \sigma_{rz} = 2G \left[ \frac{\partial^2 \phi}{\partial rdz} + \frac{\partial}{\partial r} \left( 1-\nu \nabla^2 M - \frac{\partial^2 M}{\partial z^2} \right) \right] \]

where \( G \) and \( \nu \) are the shear modulus and Poisson’s ratio respectively.

For traction free surface stress functions

\[ \sigma_{rr} = \sigma_{rz} = 0 \] at \( r = a \)

\[ \sigma_{zz} = \sigma_{rz} = 0 \] at \( z = \pm \frac{h}{2} \)

Equation (1) to (15) constitutes mathematical formulation of the problem.

Solution

To obtain the expression for temperature \( T(r, z) \):

Assume

\[ T(r, z) = T_i + \sum_{n=1}^{\infty} A_n J_0(\alpha_n r) \sinh \left[ \alpha_n \left( z + \frac{h}{2} \right) \right] \]

where \( \alpha_1, \alpha_2, \ldots \) are roots of the transcendental equation \( J_1(\alpha) = 0 \). Here \( J_n(x) \) is Bessel function of the first kind of order \( n \) and \( A_n \) is constant. The constant \( A_n \) can be found from the nature of temperature on upper face.

Using equations (3), (16) and by theory of Bessel’s function one obtains

\[ A_n = \frac{-2Q_0}{a^2 \lambda \alpha_n J_0'(\alpha_n a)} rJ_0(\alpha_n r) f(r)dr \]

equations (16) and (17) gives the required expression for steady state temperature function.

The temperature change \( \tau \) is obtained by using

\[ \tau = T - T_i \]

Hence

\[ \tau(r, z) = \sum_{n=1}^{\infty} A_n J_0(\alpha_n r) \sinh \left[ \alpha_n \left( z + \frac{h}{2} \right) \right] \]

Now suitable form of \( M \) satisfying (9) is given by

\[ M = \sum_{n=1}^{\infty} J_0(\alpha_n r) B_n \cosh \left[ \alpha_n \left( z + \frac{h}{2} \right) \right] \]

\[ + C_n \alpha_n \sinh \left[ \alpha_n \left( z + \frac{h}{2} \right) \right] \]

where \( B_n \) and \( C_n \) are arbitrary functions.

Assuming displacement function \( \phi(r, z) \) as

\[ \phi(r, z, t) = \left( z + \frac{h}{2} \right) \sum_{n=1}^{\infty} D_n J_0(\alpha_n r) \cosh \left[ \alpha_n \left( z + \frac{h}{2} \right) \right] \]

Using \( \phi \) in (1), one have

\[ D_n = \frac{KA_n}{\alpha_n} \]

Thus equation (20) become

\[ \phi(r, z) = \frac{K}{2} \left( z + \frac{h}{2} \right) \sum_{n=1}^{\infty} A_n J_0(\alpha_n r) \cosh \left[ \alpha_n \left( z + \frac{h}{2} \right) \right] \]

Now using equations (18), (19) and (21) in (7), (8) and (11) to (14), one obtains the expressions for displacements and stresses respectively as

\[ u_r = \sum_{n=1}^{\infty} J_1(\alpha_n r) \left[ \frac{-KA_n}{\alpha_n} \right] \left( z + \frac{h}{2} \right) \cosh \left[ \alpha_n \left( z + \frac{h}{2} \right) \right] \]

\[ + B_n \alpha_n^2 \sinh \left[ \alpha_n \left( z + \frac{h}{2} \right) \right] \]

\[ + C_n \alpha_n^2 \left[ \cosh \left[ \alpha_n \left( z + \frac{h}{2} \right) \right] + \alpha_n \left( z + \frac{h}{2} \right) \right] \times \cosh \left[ \alpha_n \left( z + \frac{h}{2} \right) \right] \]
\[ u_z = 2 \sum_{n=1}^{\infty} J_0(\alpha_n r) \left( \frac{K_{A_n}}{\alpha_n} \right) \cosh \left[ \alpha_n \left( z + \frac{h}{2} \right) \right] + \alpha_n \left( z + \frac{h}{2} \right) \sinh \left[ \alpha_n \left( z + \frac{h}{2} \right) \right] \]

\[ -B_n \alpha_n^2 \cosh \left[ \alpha_n \left( z + \frac{h}{2} \right) \right] = -B_n \alpha_n^2 \cosh \left[ \alpha_n \left( z + \frac{h}{2} \right) \right] + C_n \alpha_n^2 \left( 2(1-2\nu) \cosh \left[ \alpha_n \left( z + \frac{h}{2} \right) \right] \right) \]

\[ -\alpha_n \left( z + \frac{h}{2} \right) \sinh \left[ \alpha_n \left( z + \frac{h}{2} \right) \right] \]

\[ \sigma_{rr} = 2G \left( -\frac{K}{2} \right) \sum_{n=1}^{\infty} A_n \left[ \alpha_n J_0(\alpha_n r) - \frac{J_1(\alpha_n r)}{r} \right] \times \left( z + \frac{h}{2} \right) \cosh \left[ \alpha_n \left( z + \frac{h}{2} \right) \right] \]

\[ -\alpha_n \left( z + \frac{h}{2} \right) \sinh \left[ \alpha_n \left( z + \frac{h}{2} \right) \right] \]

\[ \sigma_{\theta\theta} = 2G \left( -\frac{K}{2} \right) \sum_{n=1}^{\infty} A_n \left[ \alpha_n J_0(\alpha_n r) - \frac{J_1(\alpha_n r)}{r} \right] \cosh \left[ \alpha_n \left( z + \frac{h}{2} \right) \right] \]

\[ -\alpha_n \left( z + \frac{h}{2} \right) \times \cosh \left[ \alpha_n \left( z + \frac{h}{2} \right) \right] \]

\[ \sigma_{zz} = 2G \left( \frac{K}{2} \right) \sum_{n=1}^{\infty} A_n J_0(\alpha_n r) \left( 2 \sinh \left[ \alpha_n \left( z + \frac{h}{2} \right) \right] \right) \]

\[ \left( z + \frac{h}{2} \right) \cosh \left[ \alpha_n \left( z + \frac{h}{2} \right) \right] \]

Now in order to satisfy equation (15) solving equation (24) to (27) for \( B_n \) and \( C_n \) one obtain

\[ B_n = \frac{K_{A_n}(1-2\nu)}{2\alpha_n^3} \]  

\[ C_n = \frac{K_{A_n}}{2\alpha_n^3} \]  

Using these values of \( B_n \) and \( C_n \) in equations (22) to (27) one obtain the expressions for displacements and stresses as

\[ u_r = K(1-\nu) \sum_{n=1}^{\infty} \frac{A_n J_1(\alpha_n r) \sinh \left[ \alpha_n \left( z + \frac{h}{2} \right) \right]}{\alpha_n} \]

\[ u_z = K(1-\nu) \sum_{n=1}^{\infty} \frac{A_n J_0(\alpha_n r) \cosh \left[ \alpha_n \left( z + \frac{h}{2} \right) \right]}{\alpha_n} \]

\[ \sigma_{rr} = -2GK(1-\nu) \sum_{n=1}^{\infty} \frac{A_n J_1(\alpha_n r) \cosh \left[ \alpha_n \left( z + \frac{h}{2} \right) \right]}{\alpha_n} \]

\[ \sigma_{\theta\theta} = -2GK(1-\nu) \sum_{n=1}^{\infty} \frac{A_n J_1(\alpha_n r) \cosh \left[ \alpha_n \left( z + \frac{h}{2} \right) \right]}{\alpha_n} \]

\[ \sigma_{zz} = 0 \]  

\[ \sigma_{rc} = 0 \]
Numerical Calculation

Setting \( f(r) = T_i + T_o \delta (r - b) \) \((a > b)\) at \( z = \frac{h}{2} \),

\[ (36) \]

in equation (17), where \( T_o \) is constant and \( b < a \), one has

\[ A_n = \frac{-2T_o b Q_o J_0(\alpha_n b)}{a^2 \lambda \alpha_n J_0^2(\alpha_n a) \cosh(\alpha_n h)} \]

(37)

The numerical calculation have been carried out for steel (SN 500) plate with parameters \( a = 1m, b = 0.5m, h = 0.5m \), thermal diffusivity \( k = 15.9 \times 10^{-6} \text{[m}^2\text{s}^{-1}] \) and Poisson ratio \( \nu = 0.281 \) with
\( \alpha_1 = 3.8317, \ \alpha_2 = 7.0156, \ \alpha_3 = 10.1735, \ \alpha_4 = 13.3237, \)
\( \alpha_5 = 16.470, \ \alpha_6 = 19.6159, \ \alpha_7 = 22.7601, \ \alpha_8 = 25.9037, \)
\( \alpha_9 = 29.0468, \ \alpha_{10} = 32.18 \) are the roots of transcendental equation \( J_1(\alpha_n) = 0 \).

For convenience setting
\( A = \frac{-2T_o b Q_o (1-\nu)K}{a^2 \lambda}, \ B = \frac{4T_o b Q_o (1-\nu)GK}{a^2 \lambda} \) in the expressions (16) and (30) to (35). The numerical expressions for temperature, displacement and stress components are obtained as

\[ T = T_i - \frac{2T_o b Q_o}{a^2 \lambda} \sum_{n=1}^{\infty} \left[ \frac{J_0(\alpha_n r) J_0(\alpha_n b)}{\alpha_n J_0^2(\alpha_n a) \cosh(\alpha_n h)} \right] \times \sinh \left[ \alpha_n \left( z + \frac{h}{2} \right) \right] \]

(38)

\[ \frac{u_r}{A} = \sum_{n=1}^{\infty} \left[ \frac{J_0(\alpha_n r) J_0(\alpha_n b)}{\alpha_n J_0^2(\alpha_n a) \cosh(\alpha_n h)} \right] \sinh \left[ \alpha_n \left( z + \frac{h}{2} \right) \right] \]

(39)

\[ \frac{u_z}{A} = \sum_{n=1}^{\infty} \left[ \frac{r J_0(\alpha_n r) J_0(\alpha_n b)}{\alpha_n J_0^2(\alpha_n a) \cosh(\alpha_n h)} \right] \sinh \left[ \alpha_n \left( z + \frac{h}{2} \right) \right] \]

(40)

\[ \frac{\sigma_{rr}}{B} = \sum_{n=1}^{\infty} \left[ \frac{J_0(\alpha_n b)}{\alpha_n J_0^2(\alpha_n a) \cosh(\alpha_n h)} \right] \sinh \left[ \alpha_n \left( z + \frac{h}{2} \right) \right] \]

\[ \times \left[ J_0(\alpha_n r) - \frac{J_1(\alpha_n r)}{r \alpha_n} \right] \sinh \left[ \alpha_n \left( z + \frac{h}{2} \right) \right] \]

(41)

\[ \frac{\sigma_{zz}}{B} = \frac{\sigma_{rr}}{B} \]

(42)

\[ \sigma_{zz} = \sigma_{rr} = 0 \]

(43)

In order to examine the influence of steady state temperature field on the thick plate, one performed the numerical calculations \( r = 0.0, 0.2, 0.4, 0.6, 0.8, 1 \) and \( z = 0.25, -0.125, 0, 0.125, 0.25 \) Numerical variations in radial and axial directions are shown in the figures with the help of computer programme.

Figure 1. The radial displacement function \( u_r/A \) in radial direction.

Figure 2. The radial displacement function \( u_r/A \) in axial direction.

Figure 3. The axial displacement function \( u_z/A \) in radial direction.
Concluding Remarks

In this paper a thick circular plate is considered which is free from traction and determined the expressions for temperature, displacement and stress function due to steady state temperature field. As a special case mathematical model is constructed for

\[ f(r) = T_i + T_o \delta(r-b), \quad (a > b) \]

at \( z = \frac{h}{2} \)

and performed numerical calculations. The thermoelastic behavior is examined such as temperature, displacement and stresses with the help of arbitrary heat flux is applied on the upper surface.

From figure 1 and 2, radial displacement function \( u_r \) is zero at \( r = 0, r = 1 \) and \( z = -0.25 \). Also it can observe that it shows variation on upper half of plate within annular region \( 0.4 \leq r \leq 1 \) and decreases in the direction of lower surface.

From figure 3 and 4, axial displacement function \( u_z \) shows variation on upper half of plate within circular region \( 0 \leq r \leq 1 \) and decreases in the direction of lower surface.

From figure 5 and 6, stress function \( \sigma_{rr} \) is zero at \( r = 0, r = 1 \) and \( z = -0.25 \). Also it can observe that it shows variation on upper half of plate within circular region \( 0 \leq r \leq 1 \) and decreases in the direction of lower surface.
From figure 7 and 8, the stress function $\sigma_{\theta\theta}$ shows variation on upper half of plate within circular region $0 \leq r \leq 1$ and decreases in the direction of lower surface.

It means we may find out that displacement and stress components occurs near heat source. Radial stress component $\sigma_{rr}$ develops tensile stress near heat source and compressive stress out of the heat source, where as stress component $\sigma_{\theta\theta}$ develops compressive stress near heat source and tensile stress out of heat source. Also axial stress component $\sigma_{zz}$ and resultant stress component $\sigma_{rz}$ are zero due to exchange of heat through heat transfer in axial direction (i.e. from upper surface to lower surface).

From figures of radial and axial displacements it can observe that the radial displacement occur away from the center ($r = 0$) where as axial displacement is maximum at upper surface near heat source. So it may conclude that due to heat flux applied on upper surface of plate under steady state, the plate bends concavely at the heat source i.e. ($r = 0.5$).

The results obtained here are more useful in engineering problems particularly in the determination of state of strain in thick circular plate. Also any particular case of special interest can be derived by assigning suitable values to the parameters and function in the expression (30) - (35).
