# A new species of Callicebus Thomas, 1903 (Primates, Pitheciidae) from the states of Mato Grosso and Pará, Brazil 

Juliana Gualda-Barros ${ }^{1,2}$<br>Fabio Oliveira do Nascimento ${ }^{1,3}$<br>Marilia Kerr do Amaral ${ }^{4}$

#### Abstract

A new species of titi monkey, genus Callicebus Thomas, 1903, is described based on four individuals, one from a small tributary of the left bank of Rio Teles Pires, northern state of Mato Grosso, and three others from Largo do Souza, Rio Iriri, Pará, Brazil. The new species belongs to the Callicebus moloch species group, and the main diagnostic characteristics of the new species are the whitish forehead, sideburns and beard coloration, which are contiguous, forming a frame around the blackish face; overall body pelage coloration is pale grayish-brown agouti; hands, feet and tip of the tail whitish; belly and inner sides of fore and hind limbs uniformly orange. The pattern of pelage coloration and qualitative and quantitative skull morphology are described and compared to the other species of the Callicebus moloch group. Species of the Callicebus moloch group show great similarity in skull morphology and morphometrics, making the external morphological characters, specially the chromatic fields, the most reliable diagnostic trait to identify the species.

Key-Words: Callicebus; New species; Callicebus moloch group; Brazil.

## INTRODUCTION

Callicebus Thomas, 1903 comprises mediumsized platyrrhines ranging in body mass from 1 to 2 kg , distinguished by long, colorful pelage and a long and non-prehensile tail. The genus occurs exclusively in South America, east of the Andes. This distribution includes all major tropical South American biomes, such as the Amazon Rainforest, the Pantanal, the dry and semidecidual forests of Paraguayan Chaco, Atlantic Rainforest and the adjacent semidecidual forests of eastern Brazil (Hershkovitz, 1988, 1990; Van Roosmalen et al., 2002).

The first taxonomic revision of the genus was performed by Elliot (1913) who recognized 22 monotypic species. However, Hershkovitz (1963) in his revision of Amazonian forms of the genus reducted the number of species, recognizing three polytypic species: (1) C. moloch [C. m. moloch (Hoffmannsegg, 1807); C.m.donacophilus (d'Orbigny, 1836); C. m. hoffmannsi (Thomas, 1908); C. m. brunneus (Wagner, 1842); C.m. cupreus (Spix, 1823); C. m. discolor (I. Geoffroy \& Deville); C. m. ornatus (Gray, 1866); (2) C. torquatus [C. t. torquatus (Hoffmannsegg, 1807); C.t.lugens (Humboldt, 1811); C. t. medemi (Hershkovitz, 1963)]; and

[^0](3) C. personatus (É. Geoffroy, 1812) (not included in that study).

Posteriorly, Hershkovitz (1988, 1990) recognized 13 species [C. modestus Lönnberg, 1939, C. donacophilus, C. olallae Lönnberg, 1939, C. oenanthe Thomas, 1924, C. cinerascens (Spix, 1823), C. hoffmannsi, C. moloch, C. brunneus, C. cupreus, C. caligatus (Wagner, 1842), C. dubius Hershkovitz, 1988, C. personatus, and C. torquatus), five of them polytypical (C. donacophilus, C. hoffmannsi, C. cupreus, C. personatus and C. torquatus), summing up 23 nominate taxa divided in four species group (modestus, donacophilus, moloch and torquatus). Van Roosmalen et al. (2002) recognized all the subspecies formerly recognized by Hershkovitz as full species. These authors also described two new species for the genus ( $C$. stephennashi and C. bernhardi). The article of Van Roosmalen et al. (2002) however is not a taxonomic revision in a proper way, but includes decisions and information of other taxonomical studies about the genus.

Nowadays 30 species Callicebus are recognized (Groves, 2005; Wallace et al., 2006; Rylands \& Mittermeier, 2009; Defler et al., 2010) and classified into five species groups, C. personatus, C. torquatus, C. donacophilus, C. cupreus e C. moloch (Van Roosmalen et al., 2002). The C. moloch group, is composed by six species (C. moloch, C. cinerascens, C. brunneus, C. hoffmannsi, C. baptista Lönnberg, 1939; C. bernhardi) distributed over the eastern portion of the Amazon biome, between the Rio Madeira to the west, the Amazon River to the north, the Rio Tocantins and Rio Araguaia to the east, and the central region of the Mato Grosso State to the south (Hershkovitz, 1988, 1990; Eisenberg \& Redford, 1999; Van Roosmalen et al., 2002).

In 1997 one of us (M.K.) collected a specimen of Callicebus from a small tributary of the right bank of Rio Teles Pires, state of Mato Grosso. Besides this specimen, two other individuals were collected from Rio Iriri, state of Pará, showing the same color pattern. When compared with Callicebus specimens in the collection of the Museu de Zoologia da Universidade de São Paulo (MZUSP) and others referred to in the literature they were found to belong to a hitherto unnamed form, which is described below.

## MATERIALS AND METHODS

We have studied skins and skulls deposited in the mammal collection of the Museu de Zoologia da Universidade de São Paulo (MZUSP) (Appendix 1).

Five species of the C. moloch group (C. moloch, C. cinerascens, C. brunneus, C. hoffmannsi, C. baptista) and one of $C$. donacophilus group (C. pallescens Thomas, 1907) were included in the comparative analysis. We also examined photographs of the holotype of C. remulus Thomas, 1903 (collection number BMNH 1876.6.19.1, adult, female, type locality: Santarém, Pará, Brazil), now regarded as a junior synonym of $C$. moloch, to compare with the samples from Pará.

The external qualitative characters refer to the color pattern of the pelage of the head, body, hands, feet and tail. External measurements were taken from the specimen's tags as follows: (1) head and body length (HB); (2) tail length (T); (3) fore foot length (FF); (4) hind foot length (HF); and (5) ear length (E). When only total length (TL) was provided, we subtracted the recorded tail length from total length to obtain the values of the head and body length.

Skull measurements were taken with a digital caliper at the nearest hundredth of millimeter and their definitions are as follows: greatest length of skull (GLS), from the anterior most point of the premaxilla to the posterior most point of the occipital region; condilobasal length (CBL), from anterior most point at the margin of incisive alveoli to posteriormost point of occipital condyle, greatest breadth of braincase (GBB), distance between the outermost points of the lateral surface of the brain case above the squamosal root of the zygomatic arch; zygomatic breadth (ZB), distance across the external sides of the zygomatic arches; orbital breadth ( $\mathbf{O B}$ ), distance across the external sides the orbits; postorbital breadth (POB), the least width of the skull across the postorbital constriction; nasal breadth (NL), the least distance from anterior tip of the left to the anterior tip of the right nasal bone; palatal length (PL), from the posterior most point of the alveolar edge of inner incisors to the anterior most point of the posterior border of the palate; palatal breadth (PB), the distance across the external most points of the margin of the alveoli of the first upper molars; breadth of foramen magnum (FOM), great breath of foramen magnum; bullar length (BL), greatest diameter of the auditory bulla taken perpendicular to the major axis; rostral breadth across the upper canines (RC), distance across the external most points of the borders of the left and right upper canines; maxillary toothrow length (MTR), the least distance from the anterior most point of the border of the alveolus of the upper canine to the posterior most point of the border of the alveolus of the last molar; mandible length (MBL), from the anterior most point of the mandible to the posterior
most point of the angular process; infradental-gnatio distance (IDG), the length of mandibular symphysis; coronoid process height $(\mathbf{C P H})$, a perpendicular line to the lower border of the corpus mandibulae to the top of the coronoid process; lower postcanine toothrow (LTR), from the anterior most point of the alveolus of first lower premolar to the posterior most point of the alveolus of the last molar; breadth across lower molars (M1B), breadth across the lateral most points of the alveoli of the first lower molars; breadth across lower canines (LCB), breadth across the lateral most points of the alveoli of the lowers canines.

Only adult individuals, recognized by having permanent dentition and ossified spheno-occipital suture were measured in our analysis.

Distributional data on Callicebus species were obtained by direct examination of specimens, from the literature (Paynter Jr. \& Traylor Jr., 1991; Vanzolini, 1992; Pimenta \& Silva Júnior, 2005; Gregorin, 2006) and gazetteer available on the Internet (Global Gazetteer 2.2, www.fallingrain.com/world/index.html).

Marília Kerr in the type locality on April $7^{\text {th }}, 1997$ during an expedition conducted by Dr. Paulo Emílio Vanzolini; left coronoid process damaged.

Paratypes: MZUSP 25441 (field number JLSilvaFo 105), skin and skull, adult female, collected in November $22^{\text {nd }}, 1988$, by J.L. Silva-Filho in the Largo do Souza, Rio Iriri, Pará, Brazil; the skull is very damaged, presenting only the nasals, the frontals, most part of parietals, part of the left orbit and a small part of the premaxilla, that support the upper left and right first incisors and the upper left second incisor; most part of the left side of the mandible is lost. MZUSP 25442 (field number JLSilvaFo 106), skin and skull, adult male collected in November $22^{\text {nd }}, 1988$, by J.L. Silva-Filho in the Largo do Souza, Rio Iriri, Pará, Brazil; the skull is partially damaged, with the left side of the facial region lost. MZUSP 25443 (field number JLSilvaFo 107), skin and skull, adult male collected in November $22^{\text {nd }}, 1988$, by J.L. Silva-Filho in the Largo do Souza, Rio Iriri, Pará, Brazil; the most part of the left side of skull is damaged, with the frontal, part of the parietal and squamosal bones, including the zygomatic arch, absent.

Type locality: Rio Renato, tributary of Rio Teles Pires (right bank), nearby the city of Cláudia, state of Mato Grosso, Brazil ( $11^{\circ} 33^{\prime} 00.15^{\prime \prime} \mathrm{S}, \quad 55^{\circ} 10^{\prime} 59.98^{\prime \prime W}$ W; about 370 m above sea level) (Fig. 1).

Holotype: MZUSP 34663 (field number PEV 747-748), skin and skull, adult male, collected by

FIGURE 1: Distribution of the specimens of Callicebus studied. Numbered points correspond to collection localities listed in the gazetteer (see Appendix 2).

Distribution: Known from three distant localities of the Brazilian states of Mato Grosso and Pará. In the state of Mato Grosso, the species occurs in the type locality, and a nearby Ribeiráo Carmelita (tributary of Rio Azul) ( $11^{\circ} 01^{\prime} 00.15^{\prime \prime}$ S, $54^{\circ} 28^{\prime} 59.99^{\prime \prime W}$ W) where two specimens were sighted by one of us (M.K.) but were not collected. Besides, the species possibly occurs in a third locality, Juína, in the northwestern Mato Grosso, where a male and a female were seized by Instituto Brasileiro do Meio Ambiente e dos Recursos Naturais Renováveis (IBAMA) and further were led to the Parque Zoológico Municipal Quinzinho de Barros (Sorocaba, state of Sáo Paulo; Rodrigo Teixeira, pers. comm.). However, there is not more information that indicates a more precise point in Juína region where the animals was caught. In the state of Pará, Callicebus vieirai occurs in Largo do Souza, Rio Iriri ( $04^{\circ} 00^{\prime} \mathrm{S}, 53^{\circ} 00^{\prime} \mathrm{W}$ ), in Rio Xingu.

Habitat: The locality where the holotype was collected may be described as a tropical evergreen rainforest, composed by medium-sized trees ( 20 meters high, but some them emerging up to $30-35$ meters) with lianas and forming a discontinuous canopy. The understory is relatively dense and well stratified, and the forest floor is thick. Along the Rio Renato and nearby igarapés there are some conspicuous specimens of moriche palm (Mauritia flexuosa) in swampy soil. During the collection of the holotype, another individual, possible the partner, was sighted. Six days later (April 13, 1997), another individual was vocalizing at this place on a 10 m high tree. In the nearby Ribeirão Carmelita, in April $12^{\text {dh }}, 1997$, at 17:50 o'clock, two other individuals, apparently a couple, were seen in a narrow strip of forest along the river, each individual on a different bank.

Etymology: This new species is named to honor Dr. Carlos Octaviano da Cunha Vieira (1897-1958), mammalogist and Curator of the Mammal Collection at the Museu de Zoologia da Universidade de Sáo Paulo (MZUSP), Brazil, from 1941 to 1958. During this period, the efforts of Vieira contributed to the development of the Mammal Collection of the MZUSP and he also published several scientific articles that improved the knowledge on Brazilian mammals and birds.

Diagnosis: It is a medium-sized species of the $C$. moloch group, with overall coloration pale grayish brown agouti mainly in the crown, nape, dorsum, tail and the dorsal sides of the limbs; hands, feet and tip of tail white; belly and ventral sides of limbs orangish. Clearly distinct from other members of the species group by
the white coloration present in the forehead, the crown and the beard, surrounding the dark face (Figs. 2-4, 7).

Measurements: see Table 1.

## Description of holotype

External morphology and pelage (Figs. 2-4, Tables 1-3): Length of head and body smaller than length of tail,

which is $60 \%$ of total length of the specimen. Forehead, sideburns and beard white, surrounding the blackish pigmented face; some white vibrissae present in the face around mouth and nostrils; between face and forehead there is a very narrow stripe of vibrissae with larger blackish bands alternating to narrower white bands. Crown and nape indistinct, pale grayish agouti, lighter than the dorsum, and showing shorter hairs ( 1 cm ). Dorsum and flanks pale grayish-brown agouti with longer hairs $(5 \mathrm{~cm})$. Coloration of proximal outer surface of fore and hind limbs is indistinct from that of dorsum and flanks, but becomes gradually lighter and whitish on the distal portions; hands and feet (cheiridia) are whitish. Venter and inner sides of fore and hind limbs uniformly orangish, hairs not banded. Base of tail darker than dorsum, but in the middle region the pattern become similar to the dorsum, and the tip of tail is whitish. Face, ventral side of hands and feet, ears and genitals blackish.

Skull (Fig. 5, Tables 1, 2 and 4): the skull has an overall similarity to that others $C$. moloch group species. The squamosal portion of the zygomatic arch, in lateral view, is wide on the anterior region, becoming narrow towards to posterior region. The pterygoid has
a small hamular process and the lateral lamina is well developed. The posteromedian palatine spine is absent. The pterygoid fossa is $\Omega$-shaped and its anterior border is slightly convex. The supraorbital crests are well developed. The frontal bone is depressed behind the supraorbital ridges. The frontal sinus in the glabella is slightly inflated. One infraorbital foramen on the left and two on right side. Auditory bulla comparatively large, the first third is flattened and the other two thirds bilobated and more inflated. The jugular foramen is reniform, with the right one showing a small septum. The foramen hypoglossal is rounded, smaller than the jugular foramen and localized very next each other. The lambdoidal suture does not rise towards the sagital suture, remaining in a nearly horizontal plane. Mandibular body relatively high. The coronoid process long, hook-like shaped and extending above the condilar process.

## Variation

External morphology and pelage (Fig. 6, Tables 1, 2 and 3): In the holotype (Fig. 2), the white frame present in the forehead is wide and evident,

TABLE 3: Comparisons of the chromatic fields of the pelage between C. vieirai, C. moloch, C. hoffmannsi, C. brunneus, C. cinerascens, C. baptista and C. pallescens.

| Chromatic Fields | C. vieirai | C. moloch | C. baptista | C. cinerascens | C. brunneus | C. hoffmannsi | C. pallescens |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Crown | pale grayish agouti | grayish agouti | blackish to grayish agouti | grayish agouti | yellowishbrown agouti | grayish agouti | pale grayish agouti or orangish agouti |
| Forehead | white or whitish agouti | grayish agouti | blackish to grayish agouti | grayish agouti | blackish | grayish agouti | pale grayish agouti or orangish agouti |
| Sideburns | white | orange | dark reddish brown | grayish agouti | blackish to dark reddishbrown agouti | yelowish | buffy to orangish agouti |
| Dorsum | pale grayishbrown to pale brown agouti | grayish to pale brown agouti | blackish to grayish agouti | reddish brown agouti | dark reddishbrown agouti | grayish agouti | buffy to orangish agouti |
| Flanks | pale grayishbrown agouti | grayish to pale brown agouti | blackish to grayish agouti | grayish agouti | dark reddishbrown agouti | grayish agouti | buffy to orangish agouti |
| Neck, chest and belly | pale yellowish to pale orangish | orange | dark reddish brown | grayish agouti | dark brownish | yelowish | buffy to orangish agouti |
| Hands and feet | withish agouti | buffy | blackish to grayish agouti | grayish agouti | blackish | grayish agouti | pale buffy to orangish agouti |
| Limbs (outer) | pale grayish agouti | buffy or grayish to pale brown agouti | blackish to grayish agouti | grayish agouti | dark reddishbrown agouti | grayish agouti | buffy to orangish agouti |
| Limbs (inner) | pale yellowish | orange | dark reddish brown | grayish agouti | blackish to dark reddishbrown agouti | yelowish | orangish to brownish orange |
| Tail | grayish (basis); <br> blackish <br> (middle); <br> whitish (tip) | grayish (basis); <br> blackish <br> (middle); buffy <br> (tip) | blackish to blackish agouti | grayish agouti | dark reddishbrown agouti; pale brownish tip | dark grayish agouti | buffy mixed with blackish |

whereas in specimens from Rio Iriri it is narrow and less evident (Fig. 6). The grayish-brown agouti coloration of the dorsum is darker in the paratypes, especially in MZUSP 25441. Inner side of fore limbs is slightly more orangish in MZUSP 25441 and whitish in MZUSP 25442. Hands and feet are grayish in MZUSP 25441 and MZUSP 25442. Chest and venter slightly more orangish in MZUSP 22441 and MZUSP 22443.

Skull (Tables 1, 2 and 4): the upper border of orbits of all paratypes is less salient than the holotype. In MZUSP 25443 the infraorbital foramen is proportionally larger. The squamosal portion of the zygomatic arch in MZUSP 22442, in lateral view, is narrower. In MZUSP 25443 the hypoglossal foramen is not visible while in MZUSP 25442 it is and it is also closer to the occipital condyle than to the jugular foramen, which is piriform in this specimen. The posterior portion of the auditory bulla is more inflated in MZUSP 22442 and slightly narrower in MZUSP 22443. The anterior border of pterygoid fossa is slightly concave in MZUSP 22443.

## Comparisons

The species of the C. moloch group are distributed around the area of occurence of $C$. vieirai. Another species, C. pallescens, of the C. donacophilus group is distributed south to $C$. vieirai and has a similar coloration pattern.
C. vieirai is readily distinguished from C. moloch by the white beard and sideburns, the whitish agouti hands, feet and outer side of limbs, light orange throat, chest and belly, while in C. moloch the beard and sideburns are orange, the throat, chest and belly are dark orange, the hands and feet are buffy, and outer side of limbs are buffy or grayish to pale brown agouti (Figs. 3 and 4).
C. vieirai is distinguished from C. cinerascens by the pale grayish-brown agouti coloration of dorsum, and crown, sideburns, beard, hands and feet are white or whitish, while C. cinerascens shows reddish brown agouti coloration in dorsum, and crown, sideburns, beard, hands and feet are grayish agouti.
C. vieirai is distinguished from C. baptista by white or whitish agouti forehead, white

FIGURE 5: Skull of the adult male holotype of C. vieirai (MZUSP 34663). The left coronoid process is damaged. Photographs by Marcus Vinícius Brandāo.
of specimens. All measurements in millimeters.

FIGURE 6: Detail view of the head of C. vieirai paratypes (from Rio Iriri, Pará, Brazil), showing the variation color pattern in forehead: MZUSP 25441 (female) (left), MZUSP 25442 (male) (center) and MZUSP 25443 (male) (right). Photographs by Luciano Moreira Lima.
sideburns, pale grayish brown agouti dorsum, pale yellowish coloration in the throat, chest and belly, whitish agouti hands and feet, instead of a blackish to grayish agouti forehead, dark reddish brown sideburns, throat, chest and belly, blackish to grayish agouti dorsum, and blackish to grayish hands and feet.
C. vieirai differs from C. brunneus by the overall coloration of body a pale grayish brown agouti instead of dark brown agouti, and crown, sideburns, beard, hands and feet white or whitish instead dark brown.
C. vieirai differs from C. hoffmannsi by possessing a grayish tail instead of blackish, by the white sideburns and beard instead of yellowish or orangish, and hands and feet white or whitish instead dark grayish agouti.
C. vieirai differs from C. pallescens by the white or whitish agouti forehead instead pale grayish agouti or orangish agouti, and by the absence of a perceptible white ear tufs.

Table 3 summarizes the comparisons of color patterns in the studied species.

The species of the $C$. moloch group have great similarity in skull morphology and morphometrics (Table 4), as well as a wide individual variation of
skull characters. Thus, there are few skull characters that may be used to distinguish the species of group.

The chromatic fields of pelage coloration easily distinguish the species. The distinctive pattern of coloration of each species of Callicebus may be an adaptation to recognize conspecifics, and may operate like a mechanism of reproductive isolation, especially among sympatric species, avoiding or reducing the probability of hybridization. For example, in four marmoset species (Callithrix kubli, C. penicillata, C. jacchus, and C. geoffroyi) the recognition behaviors related to facial color pattern may be interpreted as responsible for reproductive isolation mechanisms (Cavalcanti \& Langguth, 2008). These authors observed that intruders of the same species of resident individuals, recognized by the animals as potentially sexual competitors, were responsible to stimulate more responses than did intruders of different species bearing different facial color patterns, and this can be an indication of species level recognition. Further, Cavalcanti \& Langguth (2008) also suggested that if a the intruder individual is not recognized as a potencial reproductive partner of the resident mate, showing low frequency of tuft flicking and
genital display, then the matting and consequent hybridization among the species of Callithrix studied will be more difficult.

According to our data, C. vieirai has at least records from three separated geographical samples (Fig. 1). Two of them are located in the State of Mato Grosso, nearby the city of Cláudia, including the Rio Renato, Ribeirão Carmelita and surrounding areas, and another in the region of Juína, while a third sample occurs in the Largo do Souza, Rio Iriri, center-northwestern Pará. The records from Cláudia and surroundings and from Largo do Souza occur within the area of distribution of C. moloch (Fig. 1), suggesting the existence of an overlap in their respective geographic range. Nevertheless, the characters of C. vieirai are not within the variation observed in the specimens of $C$. moloch studied. The latter species shows a broader distribution, occupying the easternmost portion of general distribution of the group, occurring from the west bank of Rio Tocantins-Araguaia to the east bank of the Rio Tapajós in Pará, southwards to the headwaters of the Rios Araguaia, Xingu, and Tapajós in northern Mato Grosso and westwards to the eastern bank of the Rio Ji-Paraná in Rondônia and east bank of the Rio Aripuanã in Amazonas (Fig. 1) (de Vivo, 1985; de Vivo, unpublished data; Hershkovitz, 1990). On the other hand, according to Van Roosmalen et al. (2002) [and subsequently Pimenta \& Silva Júnior (2005)], the southwestern limit of this species is the Rio Juruena, and the Juruena-Ji-Paraná interfluvium is inhabited by a new species, C. bernhardi, described by them and consequently the samples of Callicebus from this area can be assumed to belong to this species. According to Van Roosmalen et al. (2002), C. bernhardi is distinguished of C. moloch by its grayish forehead and crown, white ear tufts, and blackish tail with a distinct white pencil. However, our analysis and comparisons between the samples of Rondônia and other localities of $C$. moloch (e.g., Fordlândia) suggest that there are not significant differences in the variation of the chromatic fields and the same variations described for C. bernhardi are found in specimens from distinct localities. In other words, the sample of Rondônia is not different from the other C. moloch samples, which agrees with the results obtained by Auricchio (2010), who suggested that C. bernhardi is a junior synonym of C. moloch.

Furthermore, the Rio Ji-Paraná apparently is not an efficient barrier to $C$. moloch. Ferrari et al. $(1996,2000)$ recorded the presence of C. moloch in the left bank of the Rio Ji-Paraná and also in two
localities far away, between the Serra dos Pacaás Novos, to the north, and the Chapada dos Parecis, to the south, where it shows evidence of a contact zone with C. brunneus. Considering the wide geographical range of $C$. moloch, we cannot reject the possibility sympatry between this species and C. cinerascens in the Rio Roosevelt - Rio Aripuanã interfluvium. Hershkovitz (1990) and de Vivo (unpublished data) suggested the occurrence of sympatry between these species in this region, however further studies in the field are necessary to confirm this hypothesis. Besides, Van Roosmalen et al. (2002) suggested that the region between the right bank of Rio Sucundurí and Rio Aripuaná and the left bank of the Rio Juruena might be inhabited either by C. hoffmannsi, which would extend its geographic range further southwards, or by a species not described yet. Within this region we recorded the specimens of $C$. vieirai from the Juina region, which is located in the left bank of the Rio Juruena.

Van Roosmalen et al. (2002) affirmed that the species of the cupreus and moloch groups are adapted to disturbed habitats and cannot occur sympatrically, due to them occupying the same ecological niche and therefore belonging to the same "ecospecies". Further, the authors also argued that sympatry in Callicebus only occur between members of the moloch/cupreus groups and the torquatus group species, and that it is very common due to the fact that these species exhibit different habitat preferences, dietary requirements, and foraging behavior. However, the ecological niche is just another attribute of a species, not a defining attribute (Groves, 2001), and as the evidences had previously shown, especially the sympatry between C. vieirai and $C$. moloch, they suggest a view contrary to Van Roosmalen et al. (2002).

According to Ferrari et al. (1996), the zoogeography of platyrrhines in southwestern Brazilian Amazonia is much more complex than it had been assumed previously. Herein, we also reinforce this affirmation and further expand it to the other regions, especially the southern and eastern parts of the Brazilian Amazonia. Additional studies, including the collection of specimens in order to suppress the geographic sample gaps, the meticulous identification of the taxa from these regions, and the application of phylogenetic studies using combined morphological, karyological and molecular data will improve the understanding of relationships among taxa of the same and different Callicebus species group, and also their respective evolutionary and biogeographic histories.

FIGURE 7: Specimens of C. vieirai kept in the Parque Zoológico Municipal Quinzinho de Barros, Sorocaba, Brazil. Photographs by Juliana Gualda-Barros.

## Conservation

In the last decades, the regions where Callicebus vieirai was recorded has suffered from constant human made changes, such as substitution of forested areas by cultivations of soybean, to raising livestock, explorative logging, and the construction of hydroelectric power plants along the main drainages of the region (Alho \& Martins, 1995; Pivello \& Coutinho, 1996; Pavan 2001; 2007; Pivello, 2003; Klink \& Machado, 2005). Some of these activities, especially livestock raising and logging, were observed on the vicinities of the type locality already in 1997. Callicebus vieirai has an unknown conservational status and further studies may reveal the real status for this species. Furthermore, the Parque Zoológico Municipal Quinzinho de Barros, Sorocaba, keeps live seven specimens of C. vieirai in exhibition (Figure 7), that were mistakenly identified as Callicebus moloch donacophilus. As previously mentioned, the original couple is from the Juina region, in northwestern Mato Grosso.

## RESUMO

Descrevemos uma nova espécie de zogue-zogue, gênero Callicebus Thomas, 1903, baseado em quatro indivíduos, um coletado em um pequeno tributário da margem direita do rio Teles Pires, Estado do Mato Grosso, e os demais no Largo do Souza, Rio Iriri, Estado do Pará, Brasil. A nova espécie pertence ao grupo de espécies Callicebus moloch e as principais características diagnósticas da nova espécie são a presença de coloração branca na fronte, nas costeletas e na barba, formando uma moldura branca ao redor da face escura; coloração geral do corpo aguti castanho acinzentado pálido; mãos, pés e extremidade da cauda são esbranquiçados; e ventre e porçöes internas dos membros anteriores e posteriores com coloração uniforme e alaranjada. Padröes de coloração da pelagem e caracteres qualitativos e comparativos cranianos também säo descritos e comparados aos das outras espécies do grupo. Os táxons do grupo de espécies Callicebus moloch apresentam grande similaridade na morfologia e morfometria do crânio, fazendo com que os caracteres morfológicos externos, especialmente os campos cromáticos da pelagem, sejam os caracteres diagnósticos mais confiáveis para a identificação das espécies. Callicebus sp. nov. e Callicebus moloch apresentam distribuição geográfica simpátrica, e os caracteres morfológicos externos claramente apontam que são duas entidades taxonômicas distintas.

Palavras-Chave: Callicebus; Nova espécie; Grupo Callicebus moloch; Brasil.

## ACKNOWLEDGEMENTS

We thank Dr. Mario de Vivo, curator of the Mammal Collection of the Museu de Zoologia da Universidade de São Paulo (MZUSP), for providing access to collection and to unpublished data on Callicebus, for the valuable suggestions and comments to improve the manuscript, and for the photographs of skins; Dr. José de Sousa e Silva Jr. for the valuable information regarding Callicebus species; Dr. Luis Fábio Silveira for valuable suggestions and comments to improve the manuscript; Dr. Fernando M. d'Horta for the photographs of the holotype in the field; Dr. Paulo Emílio Vanzolini, who led the scientific expedition to the state of Mato Grosso in 1997, when the holotype was collected; the Parque Zoológico Municipal Quinzinho de Barros (Sorocaba, Sảo Paulo, Brazil) for allowing us to visit the institution and take the pictures of the live specimens; Rodrigo Teixeira for the information on the specimens kept in the Parque Zoológico Municipal Quinzinho de Barros; Ms. Clare Valentine (Head of Colllections, Natural History Museum, London) and Mr. Roberto Portela Miguez (Mammals Section Curator, Natural History Museum, London) for the photographs of Callicebus remulus holotype; Marcus Vinícius "Puera" Brandáo for the reading of the early versions of the manuscript and especially for the photographs of the skulls; Guilherme Garbino for the comments and the English review; Carla Cristina Aquino, Dra. Caroline Cotrim Aires and Dr. Vitor Piacentini for additional comments; Lucas Leite, Agência Notícia Animal; Luciano Moreira Lima for the photographs of the skins of paratypes; Dr. Alfredo Langguth and an anonymous reviewer for the valuable suggestions in the manuscript.

Santarém: BMNH 1876.6.19.1 (photographs of the skull and skin; holotype of C. remulus). Santarém: Fazenda Marucá: MZUSP 3571, MZUSP 3572 (skull and skin). Santo Antônio: Rio Tocantins: MZUSP 13472 (skull and skin). Taperinha: MZUSP 3570 (skull and skin). Mato Grosso: Rio Arinos: MZUSP 11244 (skull and skin). Rondônia: Nova Brasília: MZUSP 18964, MZUSP 20053, MZUSP 20055, MZUSP 20058 (skull and skin); Nova Colina: MZUSP 18956 (skull and skin).

## APPENDIX 2

## Gazetteer

Amazonas: 1. Lago do Batista [ $03^{\circ} 18^{\prime} \mathrm{S}, 58^{\circ} 15^{\prime} \mathrm{W}$ ] [24 m]; 2. Lago Tapaiúna, Rio Amazonas [ $03^{\circ} 23^{\prime} \mathrm{S}, 58^{\circ} 18^{\prime} \mathrm{W}$ ] [ 28 m ]; 3. Prainha, Rio Aripuanã [ $05^{\circ} 45^{\prime} \mathrm{S}, 60^{\circ} 12^{\prime} \mathrm{W}$ ] [ 44 m ]; Pará: 4. Aruã, Rio Arapiúns [ $02^{\circ} 39^{\prime} \mathrm{S}, 55^{\circ} 43^{\prime} \mathrm{W}$ ] [33 m]; 5. Month of the Rio Bacajá [ $03^{\circ} 36^{\prime} \mathrm{S}, 51^{\circ} 54^{\prime} \mathrm{W}$ ] [112 m]; 6. Bom Jardim, Rio Amazonas [ $02^{\circ} 22^{\prime} \mathrm{S}, 51^{\circ} 00^{\prime} \mathrm{W}$ ] [37 m]; 7. Brasília Legal [ $03^{\circ} 49^{\prime} \mathrm{S}, 55^{\circ} 36^{\prime} \mathrm{W}$ ] [ 34 m ]; 8. Cachimbo [ $08^{\circ} 57^{\prime} \mathrm{S}, 54^{\circ} 54^{\prime} \mathrm{W}$ ] [ 400 m ]; 9. Caxiricatuba, Tapajós River [ $\left.02^{\circ} 36^{\prime} \mathrm{S}, 54^{\circ} 56^{\prime} \mathrm{W}\right]$ [ 102 m ]; 10. Fordlândia [ $03^{\circ} 40^{\prime} \mathrm{S}, 55^{\circ} 18^{\prime} \mathrm{W}$ ] [ 90 m ]; 11 . Mouth of the Rio Curuá [ $05^{\circ} 22^{\prime} \mathrm{S}$, $54^{\circ} 27^{\prime} \mathrm{W}$ ] [191 m]; 12. Itaituba [ $04^{\circ} 16^{\prime} \mathrm{S}$, $55^{\circ} 59^{\prime} \mathrm{W}$ ] [ 44 m ]; 13. Itapoama [ $03^{\circ} 18^{\prime} \mathrm{S}, 55^{\circ} 12^{\prime} \mathrm{W}$ ] [ 46 m ]; 14. Largo do Souza, Rio Iriri [ $04^{\circ} 01^{\prime} \mathrm{S}, 53^{\circ} 05^{\prime} \mathrm{W}$ ] [200 m]; 15. Monte Cristo, Rio Tapajós [ $04^{\circ} 06^{\prime} \mathrm{S}$, $55^{\circ} 38^{\prime} \mathrm{W}$ ] [ 11 m ]; 16. Piquiatuba, Rio Tapajós [ $02^{\circ} 27^{\prime} \mathrm{S}, 54^{\circ} 55^{\prime} \mathrm{W}$ ] [ 41 m ]; 17. Fazenda Marucá, near Santarém [ $02^{\circ} 26^{\prime} \mathrm{S}, 54^{\circ} 42^{\prime} \mathrm{W}$ ] [ 77 m ]; 18. Santo Antônio, Rio Tocantins [ $\left.02^{\circ} 54^{\prime} \mathrm{S}, 49^{\circ} 40^{\prime} \mathrm{W}\right]$ [ 51 m ]; 19. Sumaúma, Rio Tapajós [ $03^{\circ} 40^{\prime} \mathrm{S}, 55^{\circ} 30^{\prime} \mathrm{W}$ ] [ 165 m ]; 20. Taperinha [ $02^{\circ} 32^{\prime} \mathrm{S}, 54^{\circ} 17^{\prime} \mathrm{W}$ ] [ 65 m ]; 21. Urucurituba, Rio Tapajós [ $\left.03^{\circ} 45^{\prime} \mathrm{S}, 55^{\circ} 31^{\prime} \mathrm{W}\right]$ [ 71 m ]; Rondônia: 22. Alto Paraíso [ $09^{\circ} 42^{\prime} \mathrm{S}, 63^{\circ} 19^{\prime} \mathrm{W}$ ] [ 129 m ]; 23. Cachoeira Nazaré, Rio Machado (= Rio Ji-Paraná) [ $09^{\circ} 45^{\prime} \mathrm{S}, 61^{\circ} 55^{\prime} \mathrm{W}$ ] [ 100 m ]; 24. Pedra Branca [ $09^{\circ} 19^{\prime} \mathrm{S}, 62^{\circ} 49^{\prime} \mathrm{W}$ ] [111 m]; 25. Porto Velho [ $\left.08^{\circ} 45^{\prime} \mathrm{S}, 63^{\circ} 54^{\prime} \mathrm{W}\right]$ [ 84 m ]; 26. Santa Bárbara [ $\left.09^{\circ} 11^{\prime} \mathrm{S}, 62^{\circ} 55^{\prime} \mathrm{W}\right][107 \mathrm{~m}] ; 27$. Nova Colina [ $10^{\circ} 48^{\prime} \mathrm{S}, 61^{\circ} 43^{\prime} \mathrm{W}$ ] [ 160 m ]; 28. Nova Brasília [ $11^{\circ} 09^{\prime} \mathrm{S}, 61^{\circ} 34^{\prime} \mathrm{W}$ ] [ 370 m ]; Mato Grosso: 29. Cláudia [ $11^{\circ} 30^{\prime} \mathrm{S}, 54^{\circ} 53^{\prime} \mathrm{W}$ ] [ 362 m ]; 30. Ribeirão Carmelita, Cláudia [ $11^{\circ} 01^{\prime} \mathrm{S}, 54^{\circ} 28^{\prime} \mathrm{W}$ ] [ 344 m ]; 31. Juína [ $11^{\circ} 22^{\prime} \mathrm{S}$, $58^{\circ} 44^{\prime} \mathrm{W}$ ] [ 370 m ]; 32. Rio Arinos [ $12^{\circ} 21^{\prime} \mathrm{S}, 57^{\circ} 00^{\prime} \mathrm{W}$ ] [ 306 m ].

## EDITORIAL COMMITTEE

Publisher: Museu de Zoologia da Universidade de Sáo Paulo. Avenida Nazaré, 481, Ipiranga CEP 04263-000, Sáo Paulo, SP, Brasil.

Editor-in-Chief: Carlos José Einicker Lamas, Serviço de Invertebrados, Museu de Zoologia, Universidade de Sáo Paulo, Caixa Postal 42.494, CEP 04218-970, São Paulo, SP, Brasil. E-mail: editormz@usp.br.

Associate Editors: Mário César Cardoso de Pinna (Museu de Zoologia, Universidade de Sảo Paulo, Brasil); Luís Fábio Silveira (Museu de Zoologia, Universidade de São Paulo, Brasil); Marcos Domingos Siqueira Tavares (Museu de Zoologia, Universidade de São Paulo, Brasil); Sérgio Antonio Vanin (Instituto de Biociências, Universidade de São Paulo, Brasil); Hussam El Dine Zaher (Muset de Zoologia, Universidade de São Paulo, Brasil).

Editorial Board: Rüdiger Bieler (Field Museum of Natural History, U.S.A.); Walter Antonio Pereira Boeger (Universidade Federal do Paraná, Brasil); Carlos Roberto Ferreira Brandáo
(Universidade de São Paulo, Brasil); James M. Carpenter (American Museum of Natural History, U.S.A.); Ricardo Macedo Corrêa e Castro (Universidade de São Paulo, Brasil); Mario de Vivo (Universidade de São Paulo, Brasil); Marcos André Raposo Ferreira (Museu Nacional, Rio de Janeiro, Brasil); Darrel R. Frost (American Museum of Natural History, U.S.A.); William R. Heyer (National Museum of Natural History, U.S.A.); Ralph W. Holzenthal (University of Minnesota, U.S.A.); Adriano Brilhante Kury (Museu Nacional, Rio de Janeiro, Brasil); Gerardo Lamas (Museo de Historia Natural "Javier Prado", Lima, Peru); John G. Maisey (American Museum of Natural History, U.S.A.); Naércio Aquino Menezes (Universidade de São Paulo, Brasil); Christian de Muizon (Muséum National d'Histoire Naturelle, Paris, France); Nelson Papavero (Universidade de Sảo Paulo, Brasil); James L. Patton (University of California, Berkeley, U.S.A.); Richard O. Prum (University of Kansas, U.S.A.); Olivier Rieppel (Field Museum of Natural History, U.S.A.); Miguel Trefaut Urbano Rodrigues (Universidade de São Paulo, Brasil); Randall T. Schuh (American Museum of Natural History, U.S.A.); Ubirajara Ribeiro Martins de Souza (Universidade de São Paulo, Brasil); Paulo Emílio Vanzolini (Universidade de São Paulo, Brasil); Richard P. Vari (National Museum of Natural History, U.S.A.).

## INSTRUCTIONS TO AUTHORS - (April 2007)

General Information: Papéis Avulsos de Zoologia (PAZ) and Arquivos de Zoologia (AZ) cover primarily the fields of Zoology, publishing original contributions in systematics, paleontology, evolutionary biology, ontogeny, faunistic studies, and biogeography. Papéis Avulsos de Zoologia and Arquivos de Zoologia also encourage submission of theoretical and empirical studies that explore principles and methods of systematics.

All contributions must follow the International Code of Zoological Nomenclature. Relevant specimens should be properly curated and deposited in a recognized public or private, non-profit institution. Tissue samples should be referred to their voucher specimens and all nucleotide sequence data (aligned as well as unaligned) should be submitted to GenBank (www.ncbi.nih.gov/ Genbank) or EMBL (www.ebi.ac.uk).

Peer Review: All submissions to Papéis Avulsos de Zoologia and Arquivos de Zoologia are subject to review by at least two referees and the Editor-in-Chief. All authors will be notified of submission date. Authors may suggest potential reviewers. Communications regarding acceptance or rejection of manuscripts are made through electronic correspondence with the first or corresponding author only. Once a manuscript is accepted providing changes suggested by the referees, the author is requested to return a revised version incorporating those changes (or a detailed explanation of why reviewer's suggestions were not followed) within fifteen days upon receiving the communication by the editor.

Proofs: Page-proofs with the revised version will be sent to e-mail the first or corresponding author. Page-proofs must be returned to the editor, preferentially within 48 hours. Failure to return the proof promptly may be interpreted as approval with no changes and/or may delay publication. Only necessary corrections in proof will be permitted. Once page proof is sent to the author further alterations and/or significant additions of text are permitted only at the author's expense or in the form of a brief appendix (note added in proof).

Submission of Manuscripts: Manuscripts should be sent to the SciELO Submission (http:// submission.scielo.br/index.php/paz/login), along with a submission letter explaining the importance and originality of the study. Address and e-mail of the corresponding author must be always updated since it will be used to send the 50 reprints in titled by the authors. Figures, tables and graphics should not be inserted in the text. Figures and graphics should be sent in separate files with the following formats: ".JPG" and ".TIF" for figures, and ".XLS" and ".CDR" for graphics, with 300 DPI of minimum resolution. Tables should be placed at the end of the manuscript.

Manuscripts are considered on the understanding that they have not been published or will not appear elsewhere in substantially the same or abbreviated form. The criteria for acceptance of articles are: quality and relevance of research, clarity of text, and compliance with the guidelines for manuscript preparation.

Manuscripts should be written preferentially in English, but texts in Portuguese or Spanish will also be considered. Studies with a broad coverage are encouraged to be submitted in English. All manuscripts should include an abstract and key-words in English and a second abstract and keywords in Portuguese or Spanish.

Authors are requested to pay attention to the instructions concerning the preparation of the manuscripts. Close adherence to the guidelines will expedite processing of the manuscript.

Manuscript Form: Manuscripts should not exceed 150 pages of double-spaced, justified text with size 12 and source Times New Roman (except for symbols). Page format should be A4 (21 by 29.7 cm ), with 3 cm of margins. The pages of the manuscript should be numbered consecutively.

The text should be arranged in the following order: Title Page, Abstracts with Key-Words, Body of Text, Literature Cited, Tables, Appendices, and Figure Captions. Each of these sections should begin on a new page.
(1) Title Page: This should include the Title, Short Title, Author(s) Name(s) and Institutions. The title should be concise and, where appropriate, should include mention of families and/or higher taxa. Names of new taxa should not be included in titles.
(2) Abstract: All papers should have an abstract in English and another in Portuguese or Spanish. The abstract is of great importance as it may be reproduced elsewhere. It should be in a form intelligible if published alone and should summarize the main facts, ideas, and conclusions of the article. Telegraphic abstracts are strongly discouraged. Include all new taxonomic names for referencing purposes. Abbreviations should be avoided. It should not include references. Abstracts and key-words should not exceed 350 and 5 words, respectively.
(3) Body of Text: The main body of the text should include the following sections: Introduction, Material and Methods, Results, Discussion, Conclusion, Acknowledgments, and References at end. Primary headings in the text should be in capital letters, in bold and centered. Secondary headings should be in capital and lower case letters, in bold and centered. Tertiary headings should be in capital and lower case letters, in bold and indented at left. In all the cases the text should begin in the following line.
(4) Literature Cited: Citations in the text should be given as: Silva (1998) or Silva (1998:14-20) or Silva (1998: figs. 1, 2) or Silva (1998a, b) or Silva \& Oliveira (1998) or (Silva, 1998) or (Rangel, 1890; Silva \& Oliveira, 1998a, b; Adams, 2000) or (Silva, pers. com.) or (Silva et al., 1998), the latter when the paper has three or more authors. The reference need not be cited when authors and date are given only as authority for a taxonomic name.
(5) References: The literature cited should be arranged strictly alphabetically and given in the following format:

- Journal Article - Author(s). Year. Article title. Journal name, volume: initial page-final page Names of journals must be spelled out in full.
- Books - Author(s). Year. Book title. Publisher, Place.

Chapters of Books - Author(s). Year. Chapter title. In: Author(s) ou Editor(s), Book title. Publisher, Place, volume, initial page-final page.

- Dissertations and Theses - Author(s). Year. Dissertation title. (Ph.D. Dissertation) University, Place.

Electronic Publications - Author(s). Year. Title. Available at: <electronic address>. Access in date.

Tables: All tables must be numbered in the same sequence in which they appear in text. Authors are encouraged to indicate where the tables should be placed in the text. They should be comprehensible without reference to the text. Tables should be formatted with vertical (portrait), not horizontal (landscape), rules. In the text, tables should be referred as Table 1, Tables 2 and 4 , Tables 2-6. Use "TABLE" in the table heading.

Illustrations: Figures should be numbered consecutively, in the same sequence that they appear in the text. Each illustration of a composite figure should be identified by capital letters and referred in the text as: Fig. 1A, Fig. 1B, for example. When possible, letters should be placed in the left lower corner of each illustration of a composite figure. Hand-written lettering on illustrations is unacceptable. Figures should be mounted in order to minimize blank areas between each illustration. Black and white or color photographs should be digitized in high resolution (300 DPI at least). Use "Fig(s)." for referring to figures in the text, but "FIGURE(S)" in the figure captions and "fig(s)." when referring to figures in another paper.
