Abstract. A checklist of the family Chelodesmidae Cook, 1895 (order Polydesmida) from state of São Paulo, Brazil has been performed based on literature and examined material from the collection of the Instituto Butantan, São Paulo (IBSP). A total of 15 genera (7 tribes and 5 genera considered *incertae sedis*) with 64 species are listed. Among these species, 30 presented a single one record in the state, 19 with more than one record and four recorded for the first time for the state of São Paulo, and 11 species occurring in other Brazilian states. The most distributed species is *Brasilodesmus paulistus paulistus* (Brölemann, 1902) with 52 records of occurrence. In addition, a complete bibliography list of the chelodesmidan fauna from the state is compiled, as well as distribution maps for all species are provided.

Key-Words. Neotropical; Chelodesminae; Diversity; Atlantic forest; Cerrado.

INTRODUCTION

Among the representatives of the class Diplopoda, Chelodesmidae Cook, 1895 is one of the richest families, with almost 800 described species in the order Polydesmida Pocock, 1887 (Hoffman, 1980; Shear, 2011; Pena-Barbosa *et al.*, 2013). Members of the family has a wide range of colors, paranota (or keels) with a variety of shapes, and males with numerous and differentiable processes on the gonopods (Schubart, 1955; Hoffman, 1969, 1976; Pena-Barbosa *et al.*, 2013; Bouzan *et al.*, 2017).

Hoffman (1980) proposed the division of Chelodesmidae into two subfamilies, Chelodesminae Cook, 1895 for the Neotropical species, and Prepodesminae Cook, 1896 for the members from West Africa. During his lifetime, Hoffman proposed 19 tribes for Chelodesminae and only one for Prepodesminae. Among the 800 species, only 345 were assigned to tribes, in while remaining species still require new taxonomic reviews for an exact tribal designation.

Few information is known regarding the millipede fauna in general and their distribution in Brazilian territory at the moment, mainly in function of a scarcity of specialists and, consequently, of taxonomic studies about the group. In this country, the portion southeastern is one of the

best-explored region in relation to the Brazilian diversity of Chelodesmidae. For this, great part of the information concerning the millipede fauna is resulted of extensive studies made by Schubart in the last century (Knysak & Martins, 1999). The state of São Paulo, where Schubart settled after his coming to the country, performed some efforts to the knowledge of faunistic composition (Schubart 1955, 1960; Lindner *et al.*, 2012). Before him, only Brölemann (1902a) and Attems (1931) gave attention to the fauna of the state with some species described, indeed.

Thus, to promote further studies regarding Chelodesmidae from state of São Paulo, the aim of this study is to present a current list of species for the family, according to the distribution, with inclusion of new records, and richness of species in the state, as well as a relevant bibliography list of the fauna from the state is compiled.

MATERIAL AND METHODS

The list of species of the Chelodesmidae from the state of São Paulo (Fig. 1) was extracted through a series of queries on associated literature. The material examined was obtained exclusively from the millipede deposited in the collection of Instituto Butantan. The list was prepared

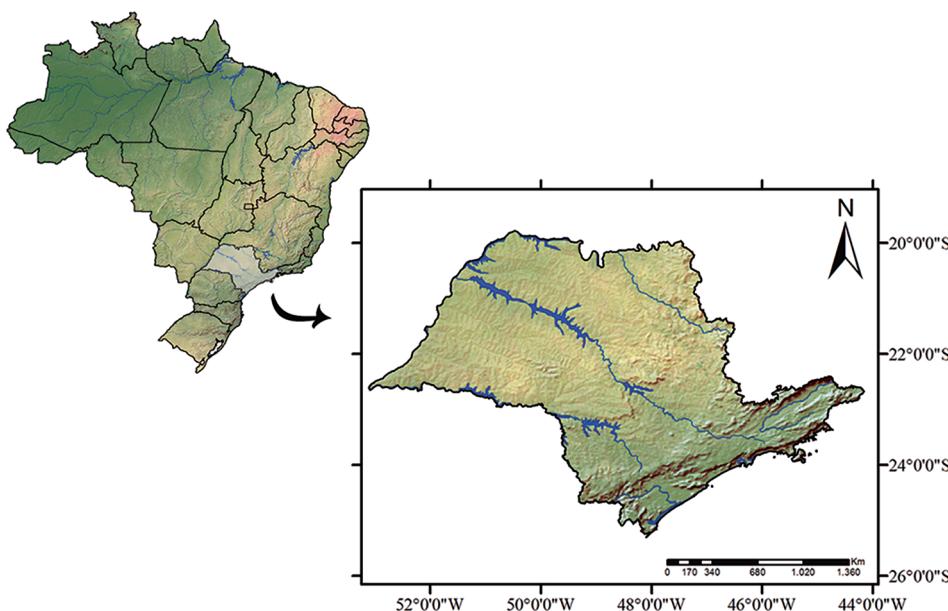

Figure 1. Map of the Brazil with São Paulo state highlighted in grey, and the map of the state detailed.

according to this structure: i) valid species name with author and the year of publication; ii) a complete chronological synonymic list with number of pages and plates/figures (if known). For this purpose, only taxonomic references were consulted; iii) type locality, types and the repository, if known; iv) records from literature; v) material examined and new records.

The material is deposited in the following institutions (curators in parentheses): FMNH, Field Museum of Natural History, Chicago, EUA (P. Sierwald); IBSP, Instituto Butantan, São Paulo, Brazil (A.D. Brescovit); MZSP, Museu de Zoologia, Universidade de São Paulo, São Paulo, Brazil (R. Pinto da Rocha); NHMW, Naturhistorisches Museum, Wien, Austria; ZMH, Zoologisches Museum Hamburg, Hamburg, Germany (M. Glaubrecht); ZSM, Zoologische Staatssammlung München, Germany (R. Melzer & S. Friedrich).

The list of species was organized following the respective tribes and genera. The species with no tribal designation was grouped in a single group *incertae sedis*. The geographical coordinates were obtained from the original literature (when provided). Species without any information about geographic coordinates were georeferenced using the geoLoc tool of species-Link (<http://splink.cria.org.br/geoloc>) for the localities. Species with no exact location provided was not recorded in the maps. The maps were obtained with the ecoregions highlighted, following the indication of colours/nomenclature according to Instituto Life, 2015: i) purple – Rupestrian Grasslands (Campos Rupestres); ii) beige – Brazilian Savanna (Cerrado); iii) light pink – Alto Paraná Atlantic Forest (Floresta Atlântica Alto Paraná); iv) dark mustard – Serra do Mar Coastal Forest (Floresta Costeira da Serra do Mar); v) orange – Araucária Moist Forest (Floresta Úmida de Araucária), (*Araucaria angustifolia* (Bertol.) Kuntze 1898); vi) light mustard – Ilha Grande Mangroves (Mangues da Ilha Grande).

Remarks: The species *Eurydesmus angulatus* deSaussure was described based upon a female from an uncertain locality in Brazil (Saussure, 1860), and after re-described by Attems (1898) from females taken at Rio de Janeiro and Santa Catarina states. In 1902, Brölemann determined as *E. angulatus* a male from São Paulo, through of non-sexual characteristics. Schubart (1945a) reinforced the male of Brölemann as *E. angulatus*. In the taxonomic revision of the genus, Hoffman (1971) transferred the Brölemann's specimen to a new name *E. brolemani*.

Historical records: BRAZIL. São Paulo: Batista Botelho (49°28'00.02"W; 23°00'19.02"S), Fazenda Nova Niágara, no data, i.1899, M.E. Gounelle coll., 1♂ (Brölemann, 1902b).

Remarks: Species under uncertain generic status (Hoffman, 1971). The original locality was mentioned erroneously as "Fazenda Nova Nicarágua", and without any reference concerning the municipality. Based in collection records of M.E. Gounelle in the state of São Paulo at the end of the 18th century (see Papavero, 1971: 162-163), the exact location is, indeed, named as "Fazenda Nova Niágara" and located on the municipality of Batista Botelho, outskirts of Cerqueira César.

Remarks: Species under uncertain generic status (Hoffman, 1971).

Tribe Lepturodesmini Hoffman, 1975 (Fig. 7A)

***Camptomorpha* Silvestri, 1897**

Camptomorpha Silvestri, 1897: 10. Type species: *Camptomorpha dorsalis* Silvestri, 1897, by subsequent designation of Attems, 1931: 44; 1938: 69 (incorrect description); Hoffman, 1953: 120-124; Schubart, 1955: 510; Jeekel, 1971: 252; Hoffman, 1980: 152.

Phantasmodesmus Verhoeff, 1927: 509. Type species: *Leptodesmus pulvillatus* Attems, 1898, by monotype; Attems, 1898: 391; 1938: 6 (Syn. with *Leptodesmus*); Hoffman, 1953: 121 (Syn. with *Camptomorpha*); Kraus, 1955: 183, 1956: 142.

Eucampesmus Chamberlin, 1941: 489. Type species: *Eucampesmus orites* Chamberlin, 1941, by original designation; Kraus, 1956: 141 (Syn. with *Phantasmodesmus*); Hoffman, 1953: 121 (Syn. with *Camptomorpha*); Jeekel, 1971: 262.

***Camptomorpha iheringi* (Brölemann, 1902)**

Leptodesmus iheringi Brölemann, 1902a: 84, Figs. 82-89 (Male holotype, MZSP, from Piquete, 45°11'10.11"W; 22°36'25.88"S, São Paulo, Brazil); Brölemann, 1909: 69.

Camptomorpha iheringi: Attems, 1938: 71, Fig. 82; Schubart, 1943: 148, 1955: 511.

Historical records: BRAZIL. São Paulo: Piquete (45°11'10.11"W; 22°36'25.88"S), i.1897, no coll., 1♂ (Brölemann, 1902a).

Remarks: According to Hoffman (1953), *C. iheringi* is under a generic doubtful position, being the species of *Camptomorpha strictu sensu* restricted to a small group from northern Andean region and Brazilian Amazonian forest.

Tribe Sandalodesmini Hofmann, 1982 (Fig. 7B)

***Sandalodesmus* Silvestri, 1902**

Sandalodesmus Silvestri, 1902: 4. Type species: *Sandalodesmus bertonii* Silvestri, 1902, by monotypy; Brölemann, 1916: 552; Jeekel, 1971: 286; Hoffman, 1980: 155; 1982: 248.

Gonioleptodesmus Schubart, 1958: 29. Type species: *Leptodesmus gasparae* Schubart, 1944, by original designation. Hoffman, 1967: 34, 1980: 154, 155 (Syn.); Shelley et al., 2000: 103.

***Sandalodesmus araujoi* Schubart, 1946**

Leptodesmus araujoi Schubart, 1946: 171, Fig. 4 (Male holotype, MZSP, from Rodrigues Alves, São Manuel, 48°34'00.13"W; 22°44'12.63"S, São Paulo, Brazil); Schubart, 1955: 516.

Leptodesmus (Gonioleptodesmus) araujoi: Schubart, 1958: 29.

Gonioleptodesmus araujoi: Hoffman, 1967: 34.

CONCLUSIONS

Since the chelodesmid fauna has been studied in Brazil from the beginning of the 19th century, 11 genera and 68 species were recorded from the state of São Paulo (Schubart, 1955), including erroneously some species recorded from the municipalities of Itatiaia and Rezende from the state of Rio de Janeiro (Schubart, 1955). Based on the data presented herein, 64 species (of ca. 800 species) and 15 genera (of 171 genera) are recorded from São Paulo. Among these species, 30 have only one register documented in the state, and 11 species occurs in other states, as *Eurydesmus aguirrei*, *Leptodesmus godoii*, *Leptodesmus tridentatus*, *Brasilodesmus lamellosus*, *Henrisaussurea ramosa* (Minas Gerais state), *Leptodesmus defensus* (Goiás state), *Brasilodesmus decipiens*, *Leptodesmus pubescens* (Paraná state), *Brasilodesmus catharinensis* (Santa Catarina and Paraná states), *Atlantodesmus itapurensis* (Mato Grosso Sul state), and *Iguazus ornithopus* (Mato Grosso do Sul state and Argentina). The most distributed species in São Paulo is *Brasilodesmus paulistus paulistus* (Strongylomorphini) with 52 records. For 12 species, new records in the state were added, and four species were recorded for the first time to São Paulo (*Leptodesmus defensus*, *L. tridentatus*, *L. pubescens* and *Brasilodesmus decipiens*).

The occurrence of the genus *Camptomorpha* (Lepturodesmini) is under doubt, since the species *C. iheringi* is no longer part of the current classification of the genus (Hoffman, 1953), but at the same time that was not included in another genus. The same situation is referred to some species previously described as belonging to *Leptodesmus*, after the last revision of the genus by Hoffman (1971).

For the state of São Paulo, the main areas with the most number of records are resulted of successive collection efforts by Schubart, especially for regions from Paranapiacaba (known as Alto da Serra) and Pirassununga (and neighboring municipalities). According to Oliveira et al. (2016), most of the Brazilian terrestrial biodiversity (including data of the polydesmid group) has a pattern of spatially based collection effort, especially in roadside areas. This pattern is highly related to the species of Chelodesmidae from São Paulo, since most of the material was collected in farms and Research Stations (Schubart, 1944, 1955, 1960). It is important to highlight that these regions are also relevant for other millipedes groups in the state, especially for Paradoxosomatidae (Schubart, 1944, 1955a; Nguyen & Sierwald, 2013), Spirostreptida (Spirostreptidae and Pseudonannolidae) (Krabbe, 1982; Jeekel, 2004; Iniesta & Ferreira, 2014), and Spirobolida (genus *Rhinocricus*) (Schubart, 1951c; Marek et al., 2003).

Since one of the first catalogs of millipedes from Brazil, Schubart has already emphasized the fast rate of environmental degradation from São Paulo state (Schubart, 1955). This fact is more worrying for the species with a single occurrence, since their distribution are from municipalities with small fragments of native forest nowadays. Until the moment, it is clear an underestimation Brazilian millipede fauna. Even for the regions with previous studies, as to southeast region (Brölemann, 1902a; Schubart 1944, 1945b, 1951a, 1955), Pantanal (Golovatch et al., 2005) and central Amazonia (Adis et al., 2002), there are still a large gap on the real richness of the species, making it necessary further studies to provide information concerning the millipede fauna from Brazil.
