

Desmids (Desmidiaceae, Zygnematophyceae) with cylindrical morphologies in the coastal plains of northern Bahia, Brazil

Ivana Batista de Oliveira^{1,3}, Carlos Eduardo de Mattos Bicudo² and Carlos Wallace do Nascimento Moura¹

Received: 21 November, 2012. Accepted: 5 September, 2013

ABSTRACT

Our knowledge of desmids with cylindrical morphologies in the state of Bahia, Brazil, is quite limited, only 13 such taxa having been described to date. The present study reports the results of a taxonomic inventory of desmids (Desmidiaceae) with cylindrical morphologies from the coastal plains of northern Bahia. During the summer months (January-March) and winter months (June-August) of two separate years (2007 and 2009), we collected a total of 90 samples of planktonic and periphytic material from lotic and lentic environments within three environmentally protected areas within the state (Rio Capivara, Lagoas de Guarajuba, and Litoral Norte). We identified 32 taxa, distributed among six genera (*Docidium*, *Haploetaenium*, *Ichthyocercus*, *Pleurotaenium*, *Tetmemorus*, and *Triploceras*); three were new additions to the algal flora of Brazil (*Haploetaenium minutum* var. *minutum*, *f. maius*, *Ichthyocercus angolensis*, and *Pleurotaenium coronatum* var. *nodulosum*). In addition, the geographical distributions of 20 taxa were expanded to include northeastern Brazil. The genus *Docidium* was reported for the first time in Bahia.

Key words: Continental algae, Streptophyta, Taxonomic inventory

Introduction

The family Desmidiaceae (Desmidiales, Zygnematophyceae) comprises unicellular organisms, some uniserial with “filamentous” habits or, more rarely, colonial without any definite shape (Martins 1982; Acleto & Zúñiga 1998; Yixin & Minjuan 2005; Graham *et al.* 2009). Although this family demonstrates significant species richness, comprising approximately 70% of the total number of known species of Zygnematophyceae (Gontcharov & Melkonian 2005), those taxa are distributed non-uniformly among the 36 recognized genera.

Desmidiaceae are characterized by having cells that are circular, flattened, or angular when viewed vertically and have an accentuated median sinus (Kouwets & Coesel 1984). Among the 36 genera that compose the Desmidiaceae, six have cylindrical and elongated morphologies: *Docidium* Bréb. ex Ralfs; *Haploetaenium* T.Bando; *Ichthyocercus* West & G.S. West; *Pleurotaenium* Nägeli; *Tetmemorus* Ralfs ex Ralfs; and *Triploceras* J.W. Bailey. The last five of those have all appeared in studies undertaken in the state of Bahia, Brazil, by Förster (1964), Martins & Bicudo (1987) and Bicudo & Martins (1989), who collectively inventoried a total of 13 taxa.

With the goal of expanding knowledge of desmids in the state of Bahia, we conducted a taxonomic inventory of Desmidiaceae genera with cylindrical morphologies that occurring in three environmentally protected areas (EPAs) in the coastal plains of northern Bahia.

Materials and methods

This study was conducted within the Lagoas de Guarajuba EPA (230 ha), the Rio Capivara EPA (1800 ha), and the Litoral Norte EPA (144,000 ha), the exact locations of which are shown in Fig. 1.

During the summer months (January-March) and winter months (June-August) of two separate years (2007 and 2009), we collected a total of 90 samples: 30 from the Lagoas de Guarajuba EPA, 30 from the Rio Capivara EPA and 30 from the Litoral Norte EPA. The material was collected according to standard methodologies for taxonomic studies of microalgae (Bicudo & Menezes 2006).

The metric characteristics of the populations were determined with an ocular micrometer; photomicrographs were taken with a digital camera coupled to an optical microscope; and the species identifications were based on the specialized literature.

Figure 1. Map of the state of Bahia and its environmentally protected areas: A. Rio Capivara, B. Lagoas de Guarajuba, C. Litoral Norte.

Based on Oliveira *et al.* (2011).

The samples were preserved in Transeau's solution (prepared according to Bicudo & Menezes 2006), and subsequently incorporated into the liquid collection of the Herbarium of the (Bahia) State University of Feira de Santana (code, HUEFS).

Results and discussion

The analyses of the 90 samples resulted in the identification of 32 taxa belonging to six genera: *Docidium*, *Haplotaenium*, *Ichthyocercus*, *Pleurotaenium*, *Tetmemorus* and *Triloceratas*.

Docidium Bréb. ex Ralfs, 1848

Docidium baculum Bréb. ex Ralfs var. ***baculum***, Brit. Dem.: 158, pl. 33, fig. 5. 1848.

Fig. 2-3

Cells ca. 23-27 times longer than wide (215-330 μm long by 12.5-15 μm wide), isthmus 10-11 μm wide, apex 7-9

μm wide, outline cylindrical, median constriction shallow, poorly defined, median sinus open, isthmus region marked by pleats, lateral margins retuse, parallel, apical margins smooth, rounded; cell walls hyaline, smooth; chloroplast axial, laminar, 2-8 axial pyrenoids.

Distribution in Brazil: Amazonas (Förster 1969); Goiás (Förster 1964).

Material selected: **Brazil. Bahia:** Conde, APA Litoral Norte, 01/III/2009, Oliveira & Moura s.n. (HUEFS 155658, HUEFS 155660), 11/VII/2009, Oliveira *et al.* s.n. (HUEFS 155720); Entre Rios, APA Litoral Norte, 26/VII/2009, Oliveira & Farias s.n. (HUEFS 155748, HUEFS 155754); Mata de São João, APA Litoral Norte, 14/III/2009, Oliveira & Moura s.n. (HUEFS 155706).

Docidium baculum var. *baculum* can be identified relatively easily due to its distinct morphological characters with taxonomic value, such as the pleats in the isthmus region and the smooth, rounded apical margins.

***Haplotaenium* T.Bando, 1988**

***Haplotaenium minutum* (Ralfs) T. Bando var. *minutum* f. *minutum*, J. Jap. Bot. 63: 176. 1988.**
Docidium minutum Ralfs, Brit. Desm.: 158, pl. 26, fig. 5. 1848.
Fig. 4-9

Cells ca. 11-12 times longer than wide (150-225 μm long by 12.5-20 μm wide), isthmus 11-17.5 μm wide, apex 9-16 μm wide, outline cylindrical, median constriction shallow, poorly defined, median sinus open, lateral margins retuse, parallel, apical margins rounded; cell walls hyaline, smooth; chloroplast axial, laminar, 2-8 axial pyrenoids.

Distribution in Brazil: Amazonas (Förster 1974; Martins 1982); Bahia (Martins & Bicudo 1987; Bicudo & Martins 1989); Goiás (Förster 1964); Mato Grosso (Borge 1925); Mato Grosso do Sul (Borge 1903; Sophia *et al.* 2005); Pará (Grönlund 1945; Scott *et al.* 1965); São Paulo (Borge 1918; Azevedo 1984; Bicudo *et al.* 1998).

Material selected: **Brazil. Bahia:** Camaçari, APA Lagoas de Guarajuba, 12/I/2007, Oliveira & Oliveira s.n. (HUEFS 125504); APA Rio Capivara, 12/I/2007, Oliveira *et al.* s.n. (HUEFS 125547, HUEFS 125550); Esplanada, APA Litoral Norte, 14/II/2009, Oliveira & Moura s.n. (HUEFS 155614), 12/VII/2009, Oliveira *et al.* s.n. (HUEFS 155724, HUEFS 155725); Entre Rios, APA Litoral Norte, 26/VII/2009, Oliveira & Farias s.n. (HUEFS 155776, HUEFS 155779).

Morphologically, *H. minutum* var. *minutum* f. *minutum* is very similar to *Pleurotaenium trabecula* (Ralfs) Delponte var. *rectum* (Delponte) West & G.S.West, although the latter differs by having more well-developed basal intumescence and ribbon-shaped chloroplasts.

In the material examined, we noted variations in the shapes of the apices, which were either rounded or truncated (Fig. 5 and 8), and in the basal intumescence, which was either conspicuous or inconspicuous (Fig. 6 and 9).

***Haplotaenium minutum* (Ralfs) T.Bando var. *cylindricum* (Borge) H.Krieg. In Rabenhorst, Kryptogamen-Fl. Deutschl. 13: 393, pl. 39, fig. 8. 1937.**

Penium cylindricum Borge, Ark. Bot. 1: 75, pl. 1, fig. 5. 1903.
Fig. 12

Cells ca. 12-15 times longer than wide (145-260 μm long by 12-18 μm wide), isthmus 11-16 μm wide, outline cylindrical, median constriction shallow, poorly defined, median sinus open, lateral margins retuse, parallel, apical margins rounded; cell walls hyaline, smooth; chloroplast axial, laminar, 2-8 axial pyrenoids.

Distribution in Brazil: Amazonas (Förster 1969).

Material selected: **Brazil. Bahia:** Camaçari, APA Lagoas de Guarajuba, 09/III/2007, Oliveira *et al.* s.n. (HUEFS 125527, HUEFS 125537); APA Rio Capivara, 25/VIII/2007, Oliveira *et al.* s.n. (HUEFS 125590, HUEFS 125606); Mata de São João, APA Litoral Norte, 11/I/2009, Oliveira & Moura s.n. (HUEFS 155598, HUEFS 155602), 15/II/2009, Oliveira & Farias s.n. (HUEFS 155625, HUEFS 155634); Esplanada, APA Litoral Norte, 28/II/2009, Oliveira & Farias s.n. (HUE-

FS 155641); Entre Rios, APA Litoral Norte, 26/VII/2009, (HUEFS 155748, HUEFS 155760).

The specimens analyzed coincided with the original description proposed by Borge (1903). That author described and illustrated the taxon from material collected in the state of Rio Grande do Sul as *Penium cylindricum* Borge.

The variety *cylindricum* differs from the typical variety of the species by having perfectly cylindrical cells and an almost imperceptible median swelling.

***Haplotaenium minutum* (Ralfs) T.Bando var. *crassum* (West) H.Krieg. f. *crassum*, Arch. Hydrobiol., suppl. 11: 67, pl. 6, fig. 8. 1932.**

Penium minutum (Ralfs) Cleve var. *crassum* West, Journ. Linn. Soc. Bot. 29(199-200): 130, pl. 20, fig. 1. 1892.

Fig. 10-11

Cells ca. 4.6-5.1 times longer than wide (70-77 μm long by 15-16.5 μm wide), isthmus 11-13 μm wide, outline approximately cylindrical, median constriction shallow, median sinus open, lateral margins retuse, parallel, apical margins rounded, apex truncated; cell walls hyaline, smooth; chloroplast axial, laminar, 2-4 axial pyrenoids.

Distribution in Brazil: Amazonas (Förster 1969; 1974); Bahia (Martins & Bicudo 1987); Goiás (Förster 1964); Pará (Scott *et al.* 1965).

Material selected: **Brazil. Bahia:** Camaçari, APA Lagoas de Guarajuba, 09/III/2007, Oliveira *et al.* s.n. (HUEFS 125528, HUEFS 125534); APA Rio Capivara, 08/VI/2007, Oliveira *et al.* s.n. (HUEFS 125563); Mata de São João, APA Litoral Norte, 11/I/2009, Oliveira & Moura s.n. (HUEFS 155599, HUEFS 155610), 14/III/2009, Oliveira & Moura s.n. (HUEFS 155687); Esplanada, APA Litoral Norte, 28/II/2009, Oliveira & Farias s.n. (HUEFS 155641); Entre Rios, APA Litoral Norte, 26/VII/2009, (HUEFS 155752).

The variety *crassum* differs from the typical variety of the species by having cells that are proportionately shorter and 4.9-5.8 times longer than their maximum diameter. Azevedo (1984) noted the morphological similarities of this taxon to *Actinotaenium comissulare* (de Bary) Teiling and to *Pleurotaenium minutum* (Ralfs) Delponte var. *crassum* (West & G.S.West) H.Krieg. f. *crassum* (=*Haplotaenium minutum* var. *crassum* f. *crassum*), because both show semicells whose lateral margins are parallel to each other or slightly swollen, have smooth or finely punctuated cell walls and contain a narrow axial chloroplast, the apical views of the cells being circular.

***Haplotaenium minutum* (Ralfs) T. Bando var. *excavatum* (Scott & Grönlund) T.Bando**

J. Jap. Bot. 63: 176. 1988.

Pleurotaenium minutum Ralfs var. *excavatum* A.M. Scott & Grönlund, Acta Soc. Sc. Fenn.: sér. B, 2(8): 11, pl. 2, fig. 3-4. 1957.

Fig. 13-15

Cells ca. 29.5-31 times longer than wide (280-340 μm long by 9.5-11 μm wide), apex 9.5 μm wide, outline cylin-

drical, median constriction shallow, poorly defined, median sinus open, lateral margins retuse, parallel, apical margins hollowed, angles acute; cell walls hyaline, smooth; chloroplast axial, laminar, 2-8 pyrenoids in axial series.

Distribution in Brazil: Pará (Förster 1969); São Paulo (Azevedo 1984).

Material selected: **Brazil. Bahia:** Mata de São João, APA Litoral Norte, 11/I/2009, Oliveira & Moura s.n. (HUEFS 155603), 14/II/2009, Oliveira & Moura s.n. (HUEFS 155614), 14/III/2009, Oliveira & Farias s.n. (HUEFS 155703), Esplanada, APA Litoral Norte, 28/II/2009, Oliveira & Farias s.n. (HUEFS 155731); Entre Rios, APA Litoral Norte, 26/VII/2009, (HUEFS 155785).

Haploaenium minutum var. *excavatum* differs from the typical variety of the species by having a hollow apex, acute apical angles, and cells that are approximately 30 times longer than they are wide. Morphologically, the taxon is similar to *Pleurotaenium minutum* var. *bourrellyi* Grönblad & Scott, although the latter differs by having a retuse apex and rounded angles. The variety *excavatum* also somewhat resembles the variety *longissimum* Scott & Grönblad, although the latter differs by having proportionally larger cells, an inflated apex and thick cell walls.

***Haploaenium minutum* (Ralfs) T.Bando var. *gracile* (Wille) T.Bando, J. Jap. Bot. 63: 176. 1988.**

Penium minutum var. *gracile* Wille. Forh. Vidensk.-Selsk. Christiania 1880 (11): 51, pl. II: fig. 33. 1880.

Fig. 16-17

Cells ca. 18-19 times longer than wide (180-210 µm long by 10-11 µm wide), isthmus 9-10 µm wide, apex 9-10 µm wide, outline cylindrical, median constriction shallow, poorly defined, median sinus open, lateral margins retuse, parallel, apical margins rounded; cell walls hyaline, smooth; chloroplast axial, laminar, 2-8 axial pyrenoids.

Distribution in Brazil: Amazonas (Förster 1969); Goiás (Förster 1964); Pará (Scott *et al.* 1965); Rio Grande do Sul (Sophia *et al.* 2005).

Material selected: **Brazil. Bahia:** Conde, APA Litoral Norte, 02/VIII/2009, Oliveira & Moura s.n. (HUEFS 155802, HUEFS 155819); Esplanada, APA Litoral Norte, 14/II/2009, Oliveira & Farias s.n. (HUEFS 155614), 12/VII/2009, Oliveira *et al.* s.n. (HUEFS 155724).

Haploaenium minutum var. *gracile* differs from the typical variety of the species by having slender cells, up to 20 times longer than they are wide, slight (almost imperceptible) basal swelling and rounded apical margins.

***Haploaenium minutum* (Ralfs) T. Bando var. *latum* (Kaiser) T. Bando, J. Jap. Bot. 63: 176. 1988.**

Pleurotaenium minutum (Ralfs) Delponte var. *latum* Kaiser, Krypt. Forsch. 2: 125. 1931.

Fig. 18

Cells ca. 9-10 times longer than wide (175-225 µm long by 19-23 µm wide), isthmus 15-19 µm wide, apex 14-17.5

µm wide, outline cylindrical, median constriction shallow, median sinus open, lateral margins slightly swollen, apical margins truncated, angles rounded; cell walls hyaline, smooth; chloroplast axial, laminar, 2-8 axial pyrenoids.

Distribution in Brazil: Amazonas (Thomasson 1971); São Paulo (Azevedo 1984).

Material selected: **Brazil. Bahia:** Esplanada, APA Litoral Norte, 12/VII/2009, Oliveira *et al.* s.n. (HUEFS 155724, HUEFS 155725); Entre Rios, APA Litoral Norte, 26/VII/2009, Oliveira & Farias s.n. (HUEFS 155741).

Haploaenium minutum var. *latum* differs from the typical variety of the species by having cells that are generally wider, with minimal swelling in the isthmus region and an apex that is truncated with rounded angles.

Morphologically, the taxon is similar to the variety *cylindricum* (Borge) Krieger and the variety *bourrellyi* Grönblad & Scott, both of the same species. It differs from the former by having perfectly cylindrical semicell margins, rounded apices and minimal basal swelling, whereas it differs from the latter by having apical margins that show slight depressions and semicells with parallel lateral margins.

***Haploaenium minutum* (Ralfs) Delponte var. *minutum* f. *maiis* (P. Lundell) Kossinsk.**

Flora Plant. Crypt. URSS 5(2): 279, pl. 33, fig. 10. 1960.

Penium minutum (Ralfs) Cleve f. *maiis* P. Lundell, Nova Acta R. Soc. Scient. Upsala: sér. 3, 8: 87. 1871.
Fig. 19

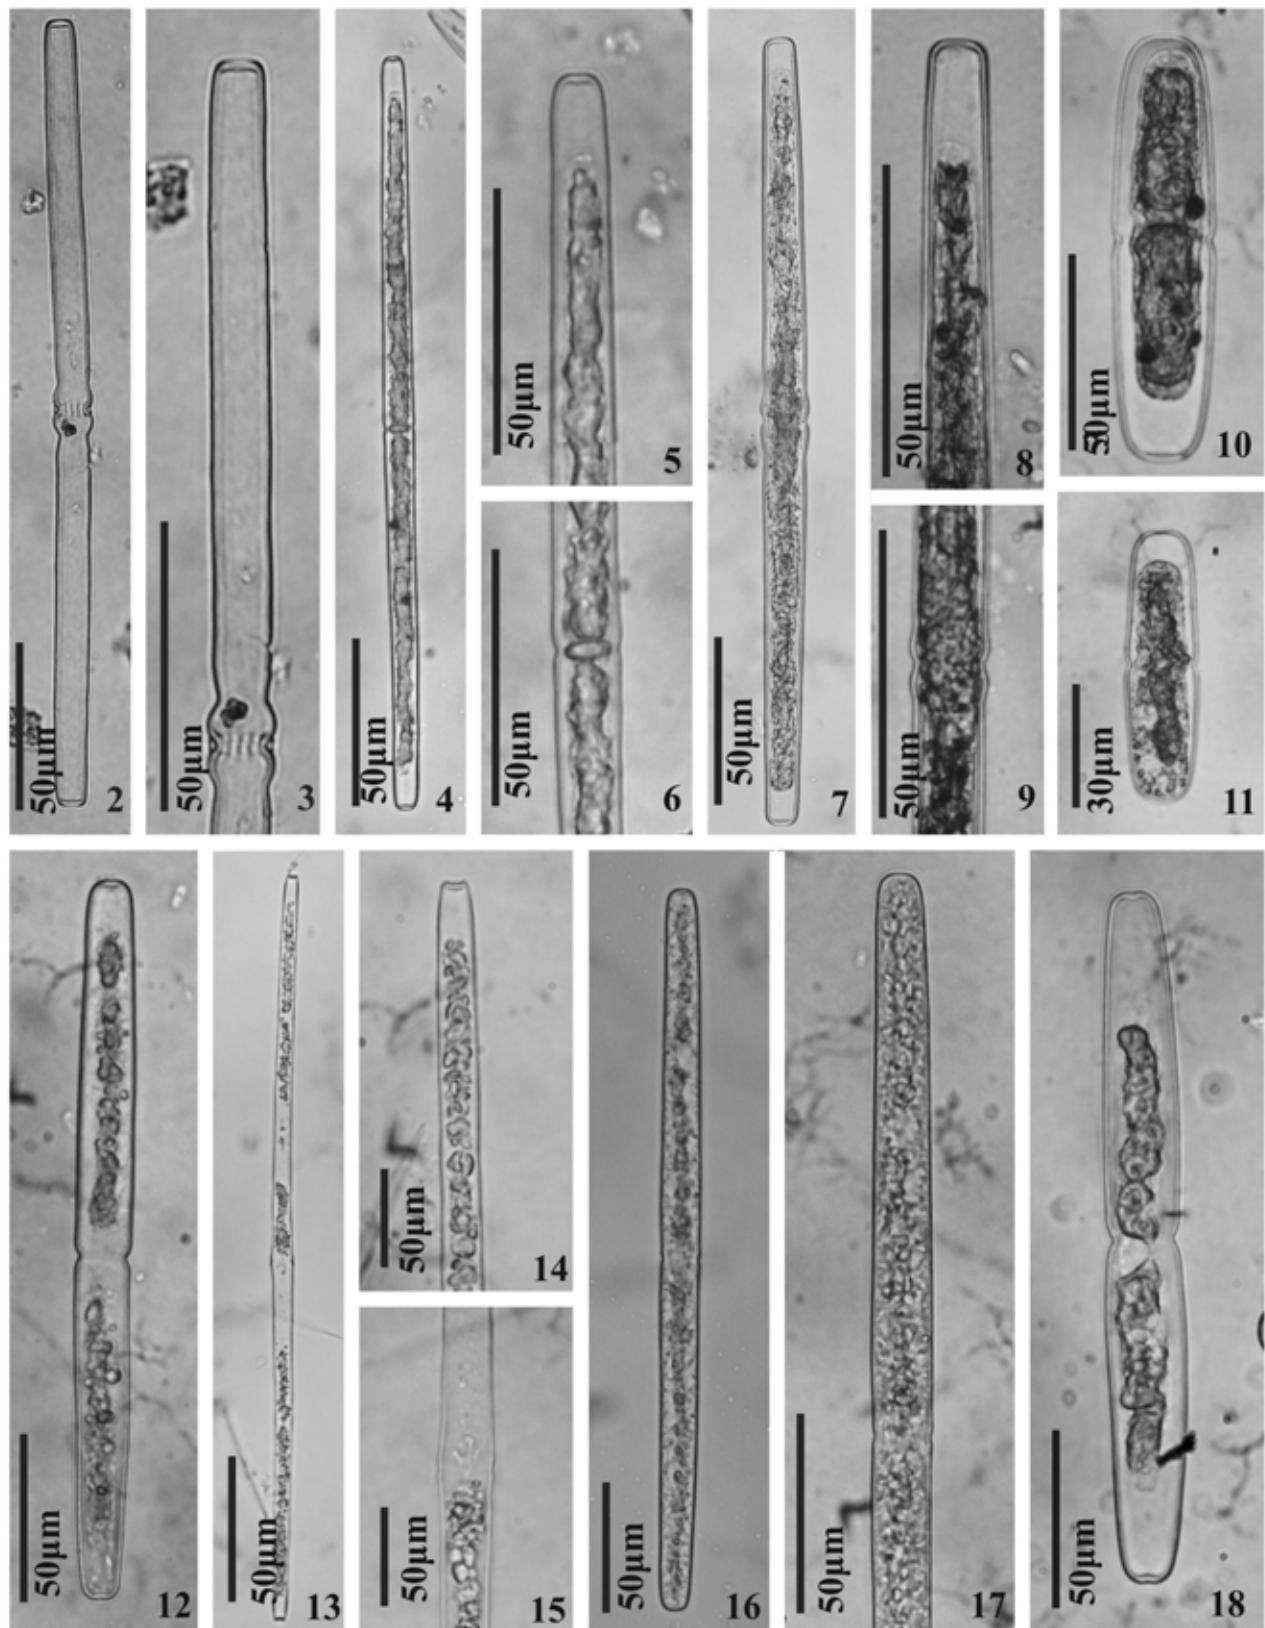

Cells ca. 16-20 times longer than wide (150-240 µm long by 8-14.5 µm wide), apex 7.5-11 µm wide, isthmus 8-12.5 µm wide, outline approximately cylindrical, median constriction shallow, open; lateral margins parallel to each other, slightly attenuated, apical margins rounded, truncated, smooth, angles rounded; cell walls hyaline, smooth; chloroplast axial, irregular, multiple pyrenoids in series.

Distribution in Brazil: Bahia (this study).

Material selected: **Brazil. Bahia:** Camaçari, APA Lagoas de Guarajuba, 09/III/2007, Oliveira *et al.* s.n. (HUEFS 125529), 20/VII/2007, Oliveira *et al.* s.n. (HUEFS 125597); APA Rio Capivara, 12/I/2007, Oliveira & Oliveira s.n. (HUEFS 125515), 08/VI/2007, Oliveira *et al.* s.n. (HUEFS 125570); Mata de São João, APA Litoral Norte, 11/I/2009, Oliveira & Moura s.n. (HUEFS 155603), 14/III/2009, Oliveira & Moura s.n. (HUEFS 155703), Esplanada, APA Litoral Norte, 28/II/2009, Oliveira & Farias s.n. (HUEFS 155641); Entre Rios, APA Litoral Norte, 26/VII/2009, Oliveira *et al.* s.n. (HUEFS 155785); Conde, APA Litoral Norte, 02/VIII/2009, Oliveira & Moura s.n. (HUEFS 155802, HUEFS 155819).

The variety *maiis* differs from the typical variety of the species by having a greater length to width ratio, the cells being 7 to 12 times longer than they are wide.

Morphologically, *Haploaenium minutum* var. *minutum* f. *maiis* is similar to *H. minutum* var. *gracile* (Wille) H.Krieg., although the former shows no basal swelling immediately below the isthmus.

Figures 2-18. Fig. 2 and 3. *Docidium baculum* Bréb. ex Ralfs var. *baculum*; Fig. 3. Detail of the apex and isthmus; Fig. 4-9. *Haplotaenium minutum* (Ralfs) T. Bando var. *minutum* f. *minutum*; 5 and 8. Detail of the apex; 6 and 9. Detail of the isthmus; Fig. 10, 11. *Haplotaenium minutum* var. *crassum* (West) Willi Krieg, f. *crassum*; Fig. 12. *Haplotaenium minutum* var. *cylindricum* (Borge) Willi Krieg.; Fig. 13-15. *Haplotaenium minutum* var. *excavatum* (A.M. Scott & Grönblad) T. Bando; Fig. 16 and 17. *Haplotaenium minutum* var. *gracile* (Wille) T. Bando; 17. Detail of the apex and isthmus; Fig. 18. *Haplotaenium minutum* var. *latum* (Kaiser) T.Bando.

The material studied here coincided with the specimens described and illustrated in the works of Prescott *et al.* (1975) and Růžička (1977, as *Pleurotaenium minutum* var. *minutum f. minutum*).

Haploetaenium rectum (Delponte) T.Bando var. *rectum*, J. Jap. Bot. 63: 176. 1988.

Pleurotaenium rectum Delponte, Mem. R. Acad. Sci. Torino: sér. 2, 30: 129, pl. 20, fig. 8-11. 1878.

Fig. 20-22

Cells ca. 16-17 times longer than wide (220-256 µm long by 13.5-15 µm wide), isthmus 11-13 µm wide, apex 9-10 µm wide, median constriction shallow, poorly defined, median sinus open, lateral margins retuse, parallel, apical margins rounded; cell walls hyaline, smooth; chloroplast axial, 2-8 axial pyrenoids.

Distribution in Brazil: Amazonas (Förster 1969; 1974); Rio de Janeiro (Sophia 1991).

Material selected: **Brazil. Bahia:** Esplanada, APA Litoral Norte, 28/II/2009, Oliveira & Farias s.n. (HUEFS 155641); Mata de São João, APA Litoral Norte, 14/III/2009, Oliveira & Moura s.n. (HUEFS 155703).

Haploetaenium rectum differs from the typical variety of the species simply by having an inconspicuous (almost imperceptible) median swelling.

Ichthyocercus West & G.S.West, 1897

Ichthyocercus angolensis West & G.S.West, Jour. Lin. Soc. Bot. 33: pl. 10, fig. 10. 1897.

Fig. 23-26

Cells 2.5-2.8 times longer than wide, not considering the angular spines (45-60 µm and 40-55 µm long with and without spines, respectively, by 15-20 µm wide), isthmus 12.5-15 µm wide, median constriction shallow, sinus open, semicells slightly twisted in the isthmus region; semicells cylindrical, lateral margins slightly swollen, apical margins convex, angles ornamented with a single, sharp robust spine; cell walls hyaline, punctuated; two axial chloroplasts.

Distribution in Brazil: Bahia (this study).

Material selected: **Brazil. Bahia:** Mata de São João, APA Litoral Norte, 14/III/2009, Oliveira & Moura s.n. (HUEFS 155703); Entre Rios, APA Litoral Norte, 26/VII/2009, Oliveira *et al.* s.n. (HUEFS 155748).

In terms of its morphology, *Ichthyocercus angolensis* can be compared to *I. longispinus* (Borge) Willi Krieg. var. *tinhareensis* D. Martins & C.E.M. Bicudo, although the latter differs by having proportionally smaller spine angles and spines with a shorter lateral projection.

Pleurotaenium Nägeli emend. Grönblad 1924

Pleurotaenium caldense Nordst. var. *cristatum* (W.B.Turner) H.Krieg., In Rabenhorst, Kryptogamen-Fl. Deutschl. 13(1): 425, pl. 46, fig. 2. 1937.

Docidium cristatum W.B.Turner, K. svenska VetenskAkad. Handl. 25(5): 32, pl. 4, fig. 7. 1892.

Fig. 27-29

Cells ca. 16-17 times longer than wide (470-550 µm long by 29-34 µm wide), apex 25-31 µm wide, isthmus 23-29 µm wide, outline cylindrical, median constriction shallow, angles rounded; lateral margins straight, parallel to each other with a single conspicuous basal intumescence; apex inflated, bordered by a single crown of globose granules, 16-18 visible in frontal view; cell walls hyaline to yellowish-brown, coarsely punctuated; chloroplasts parietal, ribbon-like, multiple pyrenoids.

Distribution in Brazil: São Paulo (Azevedo 1984; Bicudo *et al.* 1998).

Material selected: **Brazil. Bahia:** Camaçari, APA Lagoas de Guarajuba, 12/I/2007, Oliveira & Oliveira s.n. (HUEFS 125503), 09/III/2007, Oliveira *et al.* s.n. (HUEFS 125529); APA Rio Capivara, 08/VI/2007, Oliveira & Oliveira s.n. (HUEFS 125567); Mata de São João, APA Litoral Norte, 11/I/2009, Oliveira & Moura s.n. (HUEFS 155598, HUEFS 155599); Esplanada, APA Litoral Norte, 14/II/2009, Oliveira & Moura s.n. (HUEFS 155614), 28/II/2009, Oliveira & Farias s.n. (HUEFS 155641).

The variety *cristatum* differs from the typical variety of the species by having semicells with smooth lateral margins, having no undulations above the basal intumescence and cells that are 16-17 times longer than they are wide.

Pleurotaenium caldense Nordst. var. *cristatum* is morphologically identical to *P. subcoronulatum* (W.B.Turner) West & G.S.West var. *africanum* (Schmidle) H.Krieg., except for the fact that the cells of the former are always isolated and solitary, whereas those of the latter are linked pole to pole, forming false filaments, as the cells are only juxtaposed and therefore easily dissociated (Prescott *et al.* 1975; Azevedo 1984),

Pleurotaenium coronatum (Bréb.) Rabenh. var. *coronatum*, Fl. Europ. Alg.: 143. 1868.

Docidium coronatum Bréb. In Ralfs, 1848, Brit. Desm.: 217, pl. XXXV: fig. 6. 1848.

Fig. 30-32

Cells cylindrical, ca. 9-10 times longer than wide (310-440 µm long by 31-42.51 µm wide), apex 27.5-38 µm wide, isthmus 28-32 µm wide, median constriction shallow, median sinus shallow, isthmus marked by a thickened, brownish ring; semicells approximately cylindrical, lateral margins parallel to each other, slightly convergent in the direction of the apex, 3-4 slight undulations just beyond the basal intumescence. Apical margins straight, decorated with a single ring composed of 4-6 conical granules, widely spaced; cell walls hyaline to slightly brownish, scrobiculate; chloroplasts parietal, ribbon-like, multiple pyrenoids.

Distribution in Brazil: Bahia (this study).

Material selected: **Brazil. Bahia:** Mata de São João, APA Litoral Norte, 11/I/2009, Oliveira & Moura s.n. (HUEFS 155599); Entre Rios, APA Litoral Norte, 26/VII/2009, Oliveira *et al.* s.n. (HUEFS 155641), Conde, APA Litoral Norte, 02/VIII/2009, Oliveira & Moura s.n. (HUEFS 155819).

From a morphological point of view, *Pleurotaenium coronatum* var. *coronatum* is similar to *P. ehrenbergii* (Bréb.) De Bary var. *undulatum* Schaarschm., although the latter differs by having cells that are proportionally larger and are up to 23 times longer than they are wide, with notably undulating lateral margins and apical margins that are rounded and ornamented with round granules.

***Pleurotaenium coronatum* (Bréb.) Rabenh. var. *nodulosum* (Bréb.) West, Journ. Linn. Soc. Bot. 29(199-200): 119. 1892.
Docidium nodulosum Bréb. in Ralfs, Brit. Desm. 155, pl. 26, fig. 1. 1848.**

Fig. 33-35

Cells ca. 11 times longer than wide (400-480 µm long by 35-41 µm wide), apex 28-32 µm wide, isthmus 28-32 µm wide, median constriction shallow, sinus short, isthmus marked by a thickened ring, lateral margins slightly convergent towards the apex, 3-4 undulations just beyond the basal intumescence, apical margins straight, decorated with a single ring composed of 4-5 widely spaced conical granules; cell walls hyaline to yellowish, delicately punctuated; chloroplasts parietal, ribbon-like, multiple pyrenoids. Distribution in Brazil: Bahia (this study).

Material selected: **Brazil. Bahia:** Camaçari, APA Lagoas de Guarajuba, 20/VII/2007, Oliveira & Oliveira s.n. (HUEFS 125597); APA Rio Capivara, 20/VII/2007, Oliveira & Oliveira s.n. (HUEFS 125589); Mata de São João, APA Litoral Norte, 11/I/2009, Oliveira & Moura s.n. (HUEFS 155603), Esplanada, APA Litoral Norte, 14/II/2009, Oliveira & Farias s.n. (HUEFS 155612); Entre Rios, APA Litoral Norte, 26/VII/2009, Oliveira *et al.* s.n. (HUEFS 155741); Conde, APA Litoral Norte, 02/VIII/2009, Oliveira & Moura s.n. (HUEFS 155819).

Pleurotaenium coronatum (Bréb.) Rabenh. var. *nodulosum* (Bréb.) West differs from the typical variety of the species by having lateral margins that gradually narrow towards the apex, with quadrangular apical angles, prominent basal swelling and scrobiculate cell walls.

This species is morphologically similar to *Pleurotaenium coronatum* var. *robustum* West, the latter differing by having relatively wider cells and consequently a lower cell length/width ratio, the cells being approximately 8 times longer than they are wide, and the lateral margins showing uniform undulations from the base to the apex.

The populations examined in the study area were coincident with the descriptions and illustrations presented in the works of West & West (1904) and Prescott *et al.* (1975).

***Pleurotaenium coroniferum* (Borge) Willi Krieg. var. *coroniferum*, In Eabenh., Kryptog. Fl. Deutschl. 13(1): 422, pl. 45, fig. 9. 1937.**

Pleurotaenium subundulatum Borge var. *coroniferum* Borge, Ark. Bot. 1: 84, pl. 2, fig. 9. 1903.

Fig. 36-38

Cells ca. 10-12 times longer than wide (355-440 µm long by 35-37.5 µm wide), apex 25-26 µm wide, isthmus 24-25

µm wide, outline cylindrical, median constriction shallow, angles rounded; lateral margins undulating, with five conspicuous intumescences, bordered by a crown of 5-6 globose granules; cell walls hyaline to yellowish-brown; chloroplasts parietal, ribbon-like, multiple pyrenoids.

Distribution in Brazil: Mato Grosso (Borge 1925).

Material selected: **Brazil. Bahia:** Entre Rios, APA Litoral Norte, 26/VII/2009, Oliveira *et al.* s.n. (HUEFS 155748); Conde, APA Litoral Norte, 02/VIII/2009, Oliveira & Moura s.n. (HUEFS 155819).

Morphologically, *Pleurotaenium coroniferum* is similar to *P. constrictum* (Bailey) Wood var. *constrictum*, although the latter differs by having four large undulations of equal size in each semicell and an apex with 4-5 conical tubercles.

***Pleurotaenium ehrenbergii* (Bréb. ex Ralfs) Delponte var. *ehrenbergii*, Conjugate. 75, 1858.**

Docidium ehrenbergii Bréb., In Brit. Desm.: 157, pl. 26, fig. 4. 1848.

Fig. 39-41

Cells ca. 17-18 times longer than wide (400-450 µm long by 24-25 µm wide), apex 22.5-24 µm wide, isthmus 22-23.5 µm wide, median constriction shallow, lateral margins slightly undulating above median swelling; apex bordered by granules; cell walls hyaline, punctuated; apical view circular, capitulate; lateral and frontal views identical; chloroplasts ribbon-like, multiple; pyrenoids multiple.

Distribution in Brazil: Amazonas (Lopes & Bicudo 2002); Mato Grosso (Borge 1925; Camargo *et al.* 2009); Pará (Scott *et al.* 1965; Förster 1969; Thomasson 1971); Paraná (Rodrigues & Bicudo 2001; Cetto *et al.* 2004; Felisberto & Rodrigues 2008; Biolo *et al.* 2008); Rio de Janeiro (Sophia 1999); Rio Grande do Sul (Ungaretti 1981); São Paulo (Borge 1918; Bicudo 1969; Azevedo 1984; Bicudo *et al.* 1998; Ferragut *et al.* 2005).

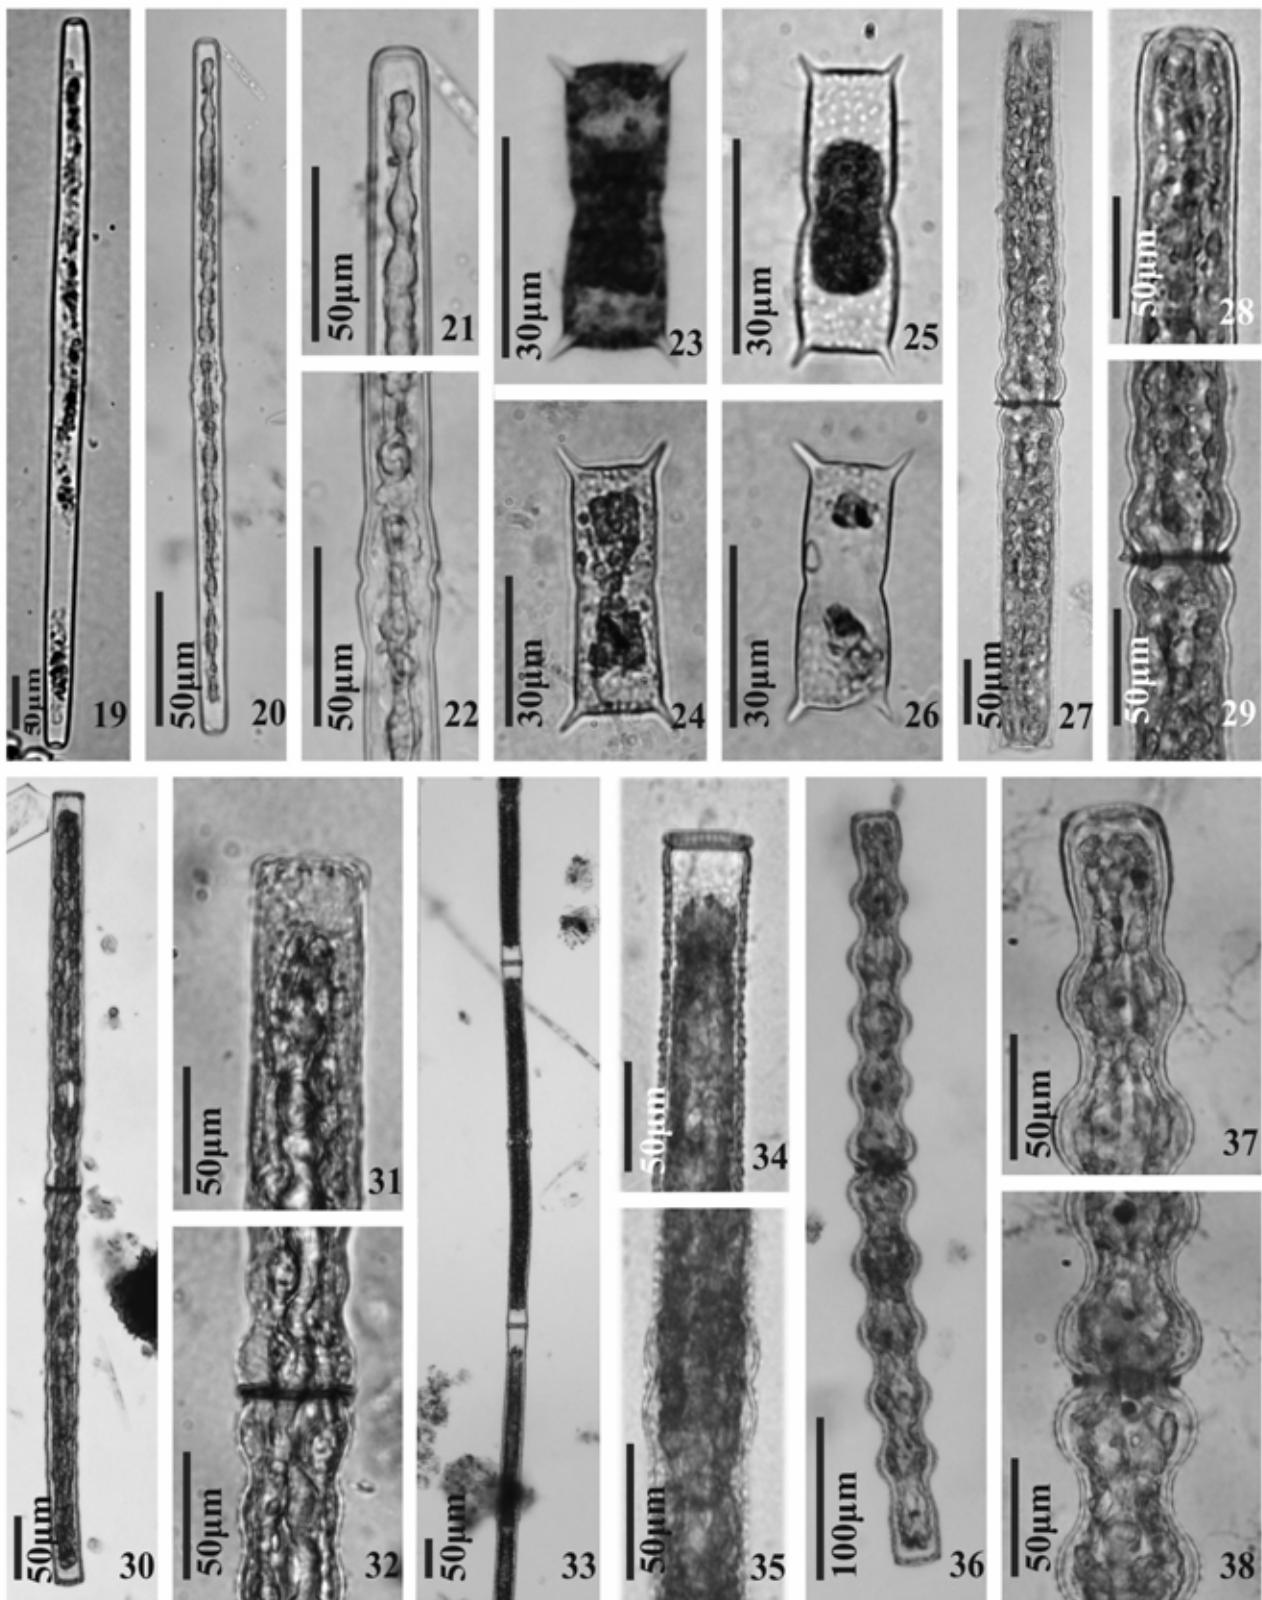

Material selected: **Brazil. Bahia:** Mata de São João, APA Litoral Norte, 11/I/2009, Oliveira & Moura s.n. (HUEFS 155610); Esplanada, APA Litoral Norte, 14/II/2009, Oliveira & Moura s.n. (HUEFS 155613), 28/II/2009, Oliveira & Farias s.n. (HUEFS 155641); Conde, 11/VII/2009, Oliveira & Moura s.n. (HUEFS 155720).

Slight variations in the numbers of undulations above the basal intumescence on the lateral margins of the semi-cells were noted, being more apparent in some specimens than in others (Fig. 41).

Azevedo (1984) noted that these undulations could vary from none to five, and because these variations could be seen even in the semicells of a single individual, they would have no taxonomic value.

***Pleurotaenium elongatum* (West, Journ. Linn. Soc. Bot. 29(199-200): 119. 1892.**

Detail of the isthmus; Fig. 36-38. *Pleurotaenium coroniferum* (Botgr) Willi Krieg. var. *coroniferum*; 37. Detail of the apex, 38. Detail of the isthmus.

Cells ca. 20-22 times longer than wide (700-780 µm long by 32-36 µm wide), apex 30-34 µm wide, isthmus 27.5-30 µm wide, median constriction shallow, lateral margins smooth, slight median swelling; apex with a single group of granules in frontal view; cell walls hyaline, punctuated; apical view circular, capitulate; lateral view identical to frontal; chloroplasts axial; pyrenoids multiple.

Distribution in Brazil: Amazonas (Förster 1963; 1969); Bahia (Bicudo & Martins 1989); Paraná (Felisberto & Rodrigues 2008); São Paulo (Azevedo 1984).

Material selected: **Brazil. Bahia:** Conde, APA Litoral Norte, 11/VII/2009, Oliveira *et al.* s.n. (HUEFS 155720), 02/VIII/2009, Entre Rios, APA Litoral Norte, 26/VII/2009, Oliveira *et al.* s.n. (HUEFS 155742); Mata de São João, APA Litoral Norte, 11/I/2009, Oliveira & Moura s.n. (HUEFS 155603), 14/III/2009, Oliveira & Moura s.n. (HUEFS 155703), Esplanada, APA Litoral Norte, 28/II/2009, Oliveira & Farias s.n. (HUEFS 155641).

Pleurotaenium ehrenbergii var. *elongatum* is morphologically quite similar to the typical variety of the species, differing only by having slender cells that are more than 20 times longer than they are wide.

Irénée-Marie (1954) described the chloroplasts of this taxon as being composed of four irregular, indistinct bands that extend from one semicell to the other, without any separation in the isthmus region, fully coincident with the material examined here (Fig. 44).

***Pleurotaenium gloriosum* (Turner) West & G.S.West, Bot. Tidsskr. 24: 167. 1901.**

Docidium gloriosum Turner 1893, S. 30, taf. 3, fig. 5. 1893. Fig. 45-47

Cells ca. 22-23.5 times longer than wide (980-1060 µm long by 43-45 µm wide), apex 43-45 µm wide, isthmus 38-40 µm wide, median constriction shallow, lateral margins undulating above the median swelling; apex with a single group of granules; cell walls hyaline, punctuated; apical view circular, capitulate; lateral and frontal views identical; chloroplasts ribbon-like, multiple; pyrenoids multiple.

Distribution in Brazil: São Paulo (Azevedo 1984).

Material selected: **Brazil. Bahia:** Mata de São João, APA Litoral Norte, 15/II/2009, Oliveira *et al.* s.n. (HUEFS 155625); Esplanada, APA Litoral Norte, 28/II/2009, Oliveira & Farias s.n. (HUEFS 155641); Conde, APA Litoral Norte, 01/III/2009, Oliveira & Farias s.n. (HUEFS 155754, HUEFS 155760).

Pleurotaenium gloriosum is similar to *P. cylindricum* (W.B.Turner) Schmidle var. *stuhlmannii* (Hieron.) Willi Krieg, in terms of their apex ornatelements, although the latter has a slightly wider cell apex and slender cells with greater cell length/width ratios.

Pleurotaenium gloriosum can also be compared to *P. simplicissimum* Grönblad var. *insigne* (Y.V. Roll) Willi Krieg., although the latter differs by having straight apical margins without lateral projections, relatively smaller cell

dimensions and slightly undulating lateral margins just above the isthmus.

***Pleurotaenium nodosum* (Bailey) Lundell var. *borgei* (Grönblad) Willi Krieg. In Rabenh., Kryptog. Fl. Deutschl. 13(1): 437, pl. 47, fig. 4. 1937.**

Pleurotaenium nodosum (Bailey) Lundell f. *borgei* Grönblad, Acta Soc. Fauna et Flora fenn. 47(4): 27, pl. 4, fig. 28. 1920. Fig. 48-51

Cells ca. 10-12 times longer than wide (380-410 µm long by 67.5-70 µm wide), apex 35-37.5 µm wide, isthmus 32.5-35 µm wide, median constriction shallow, angles rounded; lateral margins with four undulations, apex expanded, bordered by a single crown of subglobose granules composed of 5-6 granules that can be seen in frontal view; cell walls hyaline, coarsely punctuated; chloroplasts parietal, ribbon-like, multiple pyrenoids.

Distribution in Brazil: Mato Grosso (Borge 1903); São Paulo (Azevedo 1984).

Material selected: **Brazil. Bahia:** Entre Rios, APA Litoral Norte, 26/VII/2009, Oliveira *et al.* s.n. (HUEFS 155741); Conde, APA Litoral Norte, 11/VII/2009, Oliveira *et al.* s.n. (HUEFS 155720), 02/VIII/2009, Oliveira & Moura s.n. (HUEFS 155802, HUEFS 155819).

The variety *borgei* (Grönblad) Krieger was originally proposed by Grönblad (1945) based on material collected in the state of Pará. According to the author, this variety differs from the typical variety of the species by having cells that are more than 7 times longer than they are wide, an extended region between the nodule rings, subcylindrical semicells, and a straight or concave margin between the rings, with 6-10 nodules per ring.

***Pleurotaenium ovatum* (Nordst.) Nordst. var. *ovatum*, Öfv. K. Vet.-Akad. Förh. 3: 18. 1877**

Docidium ovatum Nordst., Vidensk. Meddr dansk naturh. Foren. 1869 (14/15): 205, pl. 3, fig. 37 a, e. 1869. Fig. 52

Cells ca. 2.8 times longer than wide (390-410 µm long by 140-142.5 µm wide), apex 40-42.5 µm wide, isthmus 75-77.5 µm wide, median constriction shallow, lateral margins strongly concave; apex with a single set of granules composed of 5-6 granules that can be seen in frontal view; cell walls hyaline, punctuated; apical view circular, capitulate; chloroplasts ribbon-like, multiple; pyrenoids multiple.

Distribution in Brazil: Mato Grosso (Borge 1925); São Paulo (Bicudo & Bicudo 1962; Azevedo 1984; Bicudo *et al.* 1998).

Material selected: **Brazil. Bahia:** Esplanada, APA Litoral Norte, 14/II/2009, Oliveira & Farias s.n. (HUEFS 155638).

This species was proposed, based on material collected in the state of Minas Gerais by Nordstedt (1869), as *Docidium ovatum*, and was transferred to the genus *Pleurotaenium* by the same author in 1877.

Morphologically, *Pleurotaenium ovatum* var. *ovatum* can easily be confused with *P. maskellii* Sux & Venk, although

the latter differs basically by having chloroplasts in the shape of plaques, rather than ribbons.

Pleurotaenium sceptrum (H.Roy) West & G.S. West var. *sceptrum*, Trans. Linn. Soc. Lond.: sér. 2, 5(5): 235, pl. 13, fig. 6. 1896.

Docidium sceptrum Roy, Scott. Nat.: sér. 2, 1: 39. 1883.
Fig. 53-55

Cells ca. 24-27 times longer than wide (340-435 µm long by 14-16 µm wide), apex 10-11.5 µm wide, isthmus 12.5-14 µm wide, lateral margins parallel, slightly attenuated towards the apex; median constriction shallow, apex with a single set of 4-5 pointed spines; cell walls hyaline, punctuated; chloroplast axial.

Distribution in Brazil: São Paulo (Azevedo 1984).

Material selected: **Brazil. Bahia:** Mata de São João, APA Litoral Norte, 11/I/2009, Oliveira & Moura s.n. (HUEFS 155603); Esplanada, 12/VII/2009, Oliveira *et al.* s.n. (HUEFS 155731), Oliveira & Farias s.n. (HUEFS 155641), Entre Rios, APA Litoral Norte, 26/VII/2009, Oliveira *et al.* s.n. (HUEFS 155776).

Due to an error that occurred when the species description was first published, *Pleurotaenium sceptrum* var. *sceptrum* is frequently cited in the literature as *P. tridentulum* (Wolle) West. Following the International Code of Nomenclature for Algae, Fungi, and Plants, the older, validly published name has precedence, and *P. tridentulum* is therefore the taxonomic synonym of *P. sceptrum* var. *sceptrum*.

Azevedo (1984) described smaller cell dimensions (160-320 µm × 9-18 µm) for material collected in the state of São Paulo. However, with the exception of those cell dimensions, the specimens we collected in the state of Bahia coincide with the descriptions and illustrations provided by that author.

Pleurotaenium simplicissimum Grönblad var. *insigne* (Y.V.Roll) H.Krieg, In Rabenhorst, Kryptogamen-Fl. Deutschl. 13(1): 419, pl. 44, fig. 10. 1937.

Pleurotaenium insigne Y.V.Roll, Bot. Mat. Spor. Rast. Glavn. Bot. Sada RSFSR 2: 41, fig. 12. 1923.

Fig. 56-58

Cells ca. 20-22 times longer than wide (800-940 µm long by 40-45 µm wide), apex 35-40 µm wide, isthmus 35-40 µm wide, median constriction shallow, lateral margins slightly undulating above the median swelling; apex with a single set of granules; cell walls hyaline, punctuated; apical view circular, capitulate; lateral and frontal views identical; chloroplasts ribbon-like, multiple; pyrenoids multiple.

Distribution in Brazil: São Paulo (Azevedo 1984).

Material selected: **Brazil. Bahia:** Camaçari, APA Lagoas de Guarajuba, 09/III/2007, Oliveira *et al.* s.n. (HUEFS 125533), 20/VII/2007, Oliveira *et al.* s.n. (HUEFS 125591); APA Rio Capivara, 12/I/2007, Oliveira & Oliveira s.n. (HUEFS 125518), 25/VIII/2007, Oliveira *et al.* s.n. (HUEFS 125604); Mata de São João, APA Litoral Norte, 15/II/2009, Oliveira

& Farias s.n. (HUEFS 155634); Entre Rios, APA Litoral Norte, 26/VII/2009, Oliveira *et al.* s.n. (HUEFS 155741); Conde, APA Litoral Norte, 01/III/2009, Oliveira *et al.* s.n. (HUEFS 155760), 02/VIII/2009, Oliveira & Moura s.n. (HUEFS 155819).

Morphologically, *Pleurotaenium simplicissimum* var. *insigne* is similar to *P. gloriosum*, although the latter differs by having cells that are approximately 28 times longer than they are wide.

The specimens studied here fit the original description of *P. simplicissimum* var. *insigne* by Krieger (1937), who described its cells as being approximately 22-24 times longer than they are wide.

Pleurotaenium trabecula (Ehrenb.) ex Nägeli var. *trabecula* f. *trabecula*, Gatt. einz. Algen. 104, pl. 6, fig. A. 1849.
Closterium trabecula Ehrenb., Physik, Klas. 1831: 68, pls I-IV. 1832.
Fig. 59-62

Cells ca. 11-14 times longer than wide (390-560 µm long by 34-40 µm wide), apex 28-35 µm wide, isthmus 30-38 µm wide, median constriction shallow; lateral margins parallel, narrowing slightly towards the apex, a single basal intumescence, conspicuous, sometimes 1-2 slight undulations above the basal intumescence; apical margins truncated, retuse, smooth, angles subquadrangular; cell walls hyaline, punctuated; chloroplasts parietal, various, ribbon-like; multiple pyrenoids.

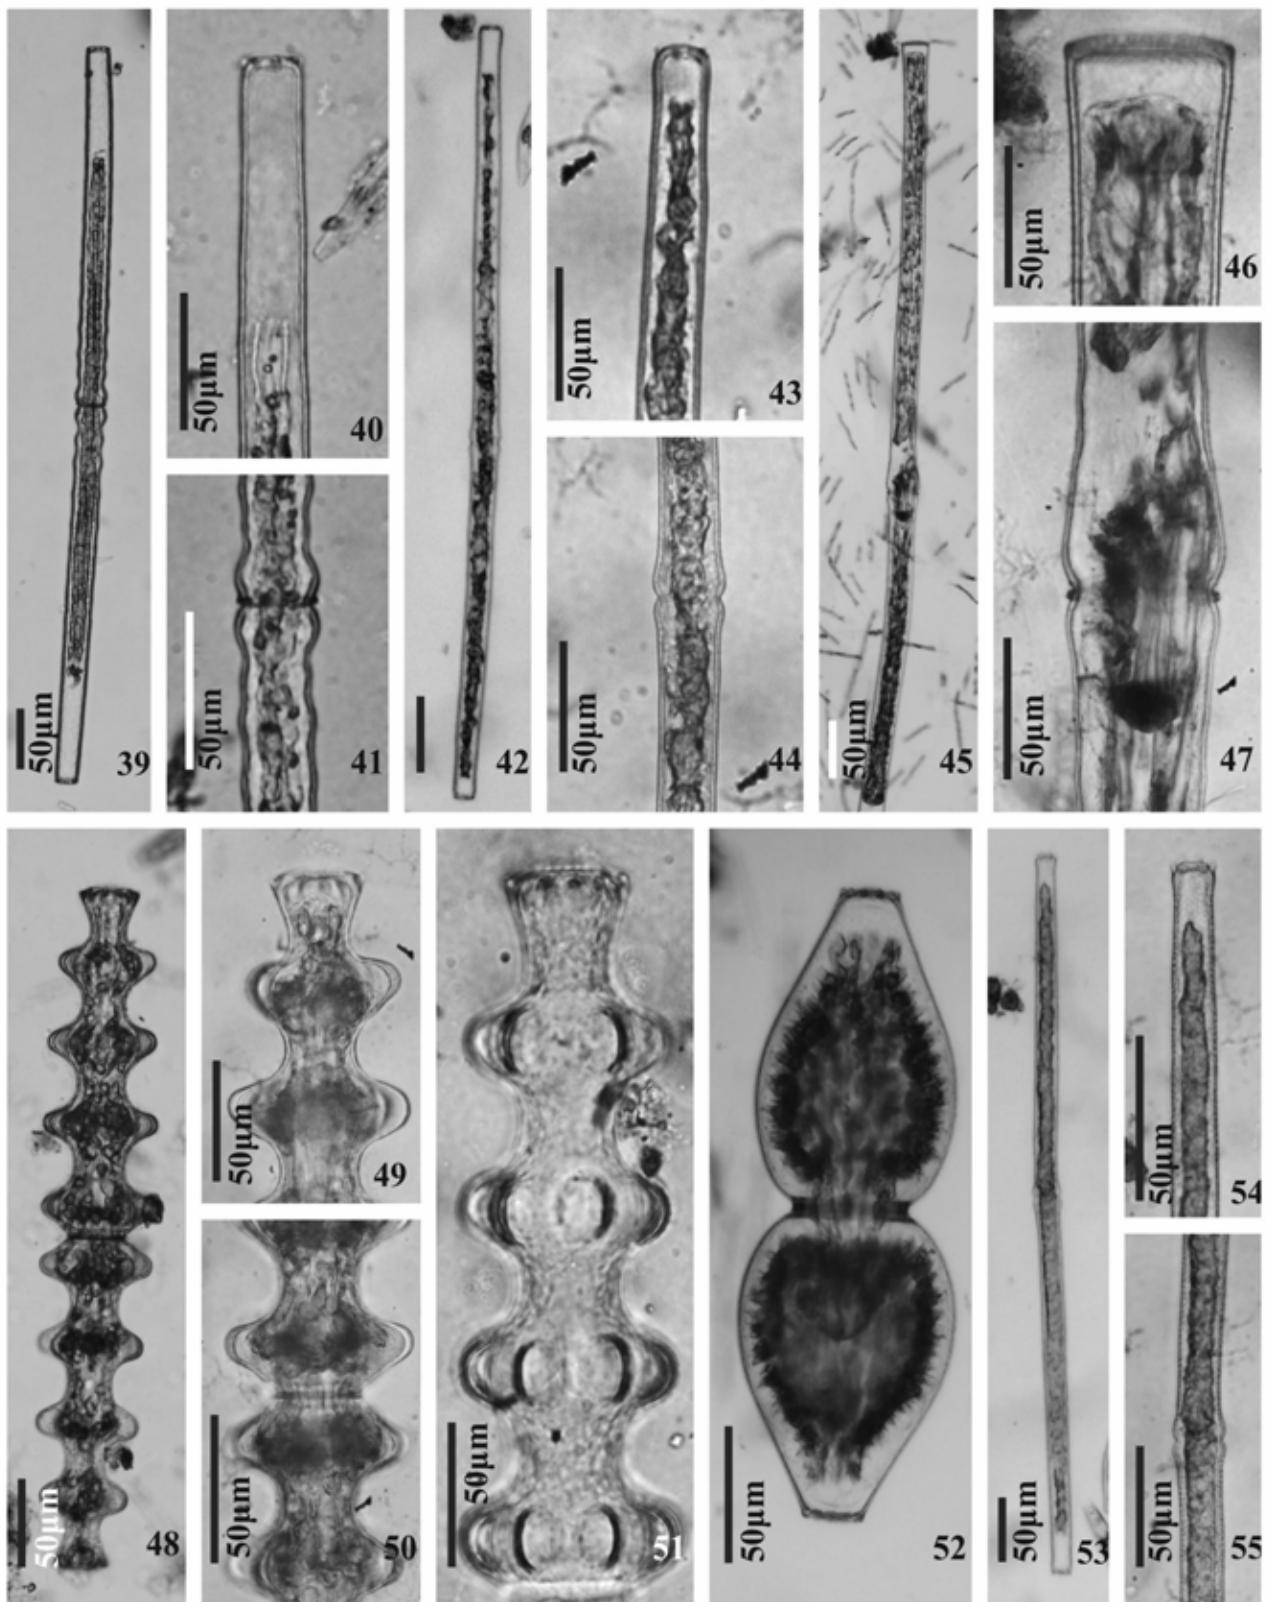

Distribution in Brazil: Bahia (Förster 1964); Goiás (Prescott 1957; Förster 1964); Minas Gerais (Bicudo 1969); Pará (Grönblad 1945; Thomasson 1971); Paraná (Cetto *et al.* 2004); Rio de Janeiro (Sophia 1999); São Paulo (Borge 1918).
Material selected: **Brazil. Bahia:** Camaçari, APA Lagoas de Guarajuba, 09/III/2007, Oliveira *et al.* s.n. (HUEFS 125526, HUEFS 125530); APA Rio Capivara, 09/III/2007, Oliveira *et al.* s.n. (HUEFS 125549); 20/VII/2007, Oliveira *et al.* s.n. (HUEFS 125583); Mata de São João, APA Litoral Norte, 11/I/2009, Oliveira & Moura s.n. (HUEFS 155603, HUEFS 155610); 15/II/2009, Oliveira & Moura s.n. (HUEFS 155634); Conde, APA Litoral Norte, 11/VII/2009, Oliveira *et al.* s.n. (HUEFS 155720).

Morphologically, *Pleurotaenium trabecula* var. *trabecula* f. *trabecula* and *P. ehrenbergii* var. *ehrenbergii* are very similar, although the latter differs by having an apex ornamented with a ring of 16 subglobose or slightly elongated granules.

Förster (1964) analyzed specimens from the states of Bahia and Goiás and reported a wider range of cell dimensions (593-742 µm in length) than that found in the present study.

Pleurotaenium trabecula (Ehrenb.) ex Nägeli var. *elongatum* Cedergr. f. *elongatum* Ark. Bot. 13(4): 12. 1913.
Closterium trabecula Ehrenb., Phys. Klas. 1831: 1-154, pls. I-IV. 1831.
Fig. 63-65

Cells ca. 19-21 times longer than wide (480-660 µm long by 24-33 µm wide), apex 18-28 µm wide, isthmus 20-25 µm

The variety *elongatum* differs from the typical variety of the species in terms of the length/width ratios of its cells, the cells of the former being 19-21 times longer than they are wide, compared with 12-17.7 times longer for the latter.

According to Prescott *et al.* (1975), individuals of *Pleurotaenium trabecula* var. *elongatum* can be up to 28 times longer than their maximum diameter.

Pleurotaenium tridentulum* (Wolle) West var. *tenuissimum
Grönblad & Croasdale Acta Bot. Fenn. 69: 30, figs. 33, 34. 1965.

***Docidium tridentulum* Wolle**, Bull. Torr. Bot. Club 11(2): 14. 1884.

Fig. 66-68

Cells ca. 23-26 times longer than wide (260-275 µm long by 10-11.5 µm wide), apex 5-6 µm wide, isthmus 9-10 µm wide, median constriction shallow; lateral margins parallel, narrowing toward the apex, apical margins undulating, smooth, angles subquadangular; cell walls hyaline, smooth; chloroplast axial; pyrenoids multiple.

Distribution in Brazil: Amazonas (Förster 1969; 1974); Pará (Scott *et al.* 1965).

Material selected: **Brazil. Bahia:** Mata de São João, APA Litoral Norte, 14/III/2009, Oliveira & Moura s.n. (HUEFS 155703); Conde, APA Litoral Norte, 02/VIII/2009, Oliveira *et al.* s.n. (HUEFS 155819).

Pleurotaenium tridentulum var. *tenuissimum* differs from the typical variety of the species by having semicells with parallel lateral margins, undulating apical margins, and acute angles, whereas the typical variety shows semicells that narrow slightly towards the apex, which is ornamented with four short, occasionally curved, spines.

Pleurotaenium verrucosum* (Bailey) P.Lundell var. *verrucosum* f. *verrucosum, Nova Acta Reg. Soc. Scient. Upsal. 3, 8: 6. 1871.

***Closterium verrucosum* Bailey**, Amer. J. Sc. & Arts 51 [sér. 2: 1] 127, fig. 4. 1846.

Fig. 69-70

Cells ca. 14-15.4 times longer than wide (385-420 µm long by 25-30 µm wide), apex 20-24 µm wide, isthmus 18-20 µm wide, median constriction shallow; lateral margins parallel, apical margins straight, ornamented with a single row of conical granules, angles subquadangular; cell walls hyaline, decorated with rounded or subquadangular plaques arranged in transversal rows, a single row of distinctly smaller plaques near the isthmus, a single row of elongated plaques near the apex; chloroplasts parietal, ribbon-like, multiple pyrenoids.

Distribution in Brazil: Amazonas (Thomasson 1971); Mato Grosso (Borge 1925); Pará (Grönblad 1945).

Material selected: **Brazil. Bahia:** Camaçari, APA Lagoas de Guarajuba, 20/VII/2007, Oliveira *et al.* s.n. (HUEFS 125596), 25/VIII/2007, Oliveira *et al.* s.n. (HUEFS 125602, HUEFS 125604, HUEFS 125605); Entre Rios, APA Litoral Norte, 26/VII/2009, Oliveira *et al.* s.n. (HUEFS 155776); Conde, APA Litoral Norte, 02/VIII/2009, Oliveira & Moura s.n. (HUEFS 155819).

The first record of *Pleurotaenium verrucosum* (Bailey) P.Lundell var. *verrucosum* f. *verrucosum* in Brazil was published by Grönblad (1945). The author presented a brief description of the species based on collections made in the state of Pará; the material studied here was fully coincident with that description.

***Tetmemorus* Ralfs ex Ralfs 1848**

Tetmemorus brebissonii* (Menegh.) Ralfs ex Ralfs var. *brebissonii, Annls Mag. Nat. Hist. 14: 257, pl. 8, fig. 1. 1844.
***Closterium brebissonii* Menegh.** Linnea. 1840.

Fig. 71-72

Cells ca. 4.6-4.8 times longer than wide (118.5-121.5 µm long by 24.5-26 µm wide), isthmus 21.5-22.5 µm wide, median constriction shallow; semicell oblong, lateral margins smooth, parallel to each other, apical margins rounded, a single median incision, shallow, closed; cell walls hyaline, with parallel longitudinal grooves, interrupted by pores; chloroplast axial; pyrenoids sparse, multiple.

Distribution in Brazil: Bahia (Martins & Bicudo 1987; Bicudo & Martins 1989); Mato Grosso (Borge 1903); São Paulo (Bicudo 1969).

Material selected: **Brazil. Bahia:** Mata de São João, APA Litoral Norte, 11/I/2009, Oliveira & Moura s.n. (HUEFS 155599, HUEFS 155603, HUEFS 155610); 14/III/2009, Oliveira & Moura s.n. (HUEFS 155706); Entre Rios, APA Litoral Norte, 26/VII/2009, Oliveira *et al.* s.n. (HUEFS 155754, HUEFS 155760).

Martins & Bicudo (1987) noted the overlapping of the minimum limits of the cell lengths of individuals of the typical variety with the maximum limits of representatives of *Tetmemorus brebissonii* var. *minor* De Bary, in addition to a pronounced concavity on the lateral margin of the semicell just above the basal intumescence.

Prescott *et al.* (1975) reported a much wider range of cell dimensions (100-264 µm long and 9-48 µm wide) in the descriptions of the material they identified.

Tetmemorus brebissonii (Menegh.) Ralfs ex Ralfs var. *minor* De Bary, Untersuch. Fam. Conjugat., p. 73. Pl. 5, fig. 19. 1858.

Closterium brebissonii Menegh. Linnea. 1840.

Fig. 73

Cells ca. 4 times longer than wide (60-75 µm long by 15-19 µm wide), isthmus 12-15 µm wide, median constriction shallow, median sinus open; semicell quadrangular, lateral margins smooth, parallel to each other, with a slight depression in the middle, apical margins rounded, a single median incision, shallow, closed; cell walls hyaline, with parallel longitudinal grooves interrupted by pores.

Distribution in Brazil: Bahia (Förster 1964).

Material selected: **Brazil. Bahia:** Mata de São João, APA Litoral Norte, 11/I/2009, Oliveira & Moura s.n. (HUEFS 155599, HUEFS 155610); Conde, APA Litoral Norte, 01/III/2009, Oliveira & Farias s.n. (HUEFS 155658); Entre Rios, APA Litoral Norte, 26/VII/2009, Oliveira *et al.* s.n. (HUEFS 155754).

Tetmemorus brebissonii var. *minor* differs from the typical variety of the species by having smaller cell dimensions and lateral margins with slight depressions in the middle, above the swelling of the isthmus, as well as ample, rounded apical margins.

Tetmemorus granulatus (Bréb.) Ralfs var. *attenuatus* West, Jour. Linn. Soc. Bot., London 29: 132, pl. 20, fig. 7. 1892.

Closterium granulatum Bréb. In Menegh. Linnea. 1840.

Fig. 74

Cells ca. 4-4.6 times longer than wide (107.5-138.5 µm long by 24-33 µm wide), isthmus 21-27.5 µm wide; median constriction shallow, median sinus open; semicell oblong, lateral margins smooth, slightly concave, delicately attenuating towards the apex, apical margins rounded, a single median incision, shallow, closed; cell walls hyaline, punctuated.

Distribution in Brazil: Bahia (Förster 1964; Martins & Bicudo 1987)

Material selected: **Brazil. Bahia:** Esplanada, APA Litoral Norte, 14/II/2009, Oliveira & Moura s.n. (HUEFS 155614), 28/II/2009, Oliveira & Moura s.n. (HUEFS 155641); Mata de São João, APA Litoral Norte, 14/III/2009 (HUEFS 155703); Entre Rios, APA Litoral Norte, 26/VII/2009, Oliveira *et al.* s.n. (HUEFS 155748).

Tetmemorus granulatus var. *attenuatus* differs from the typical variety by having semicells that narrow towards the apex.

Prescott *et al.* (1975) questioned the merit of this variety, because the attenuation that characterizes it can be seen in both this and the typical variety of the species. Despite their commentaries, those authors accepted the variety *attenuatus*.

Tetmemorus laevis (Kutz.) Ralfs var. *laevis*, Brit. Desm.: 146, pl. 24, fig. 3. 1848.

Closterium leave Kutz. 1845, 132.

Fig. 75

Cells ca. 3.8 times longer than wide (120-135 µm long by 31-34 µm wide), isthmus 24-28 µm wide, median constriction shallow, median sinus open; semicell oblong, lateral margins smooth, parallel to each other, or narrowing slightly towards the apex, apical margins rounded to truncated, a single median incision, shallow, closed; cell walls hyaline, punctuated, region near the isthmus smooth.

Distribution in Brazil: Amazonas (Förster 1969); Mato Grosso (Borge 1903); Pará (Scott *et al.* 1965); Rio de Janeiro (Nordstedt 1877; Krieger 1950; Sophia 1991).

Material selected: **Brazil. Bahia:** Entre Rios, APA Litoral Norte, 26/VII/2009, Oliveira *et al.* s.n. (HUEFS 155776, HUEFS 155779); Conde, APA Litoral Norte, 02/VIII/2009, Oliveira *et al.* s.n. (HUEFS 155802).

Prescott *et al.* (1975, pl. 56, figs. 1-3) illustrated three different shapes for *Tetmemorus laevis* var. *laevis*, one of their figures (fig. 2) resembling *T. brebissonii* var. *minor* De Bary in having an approximately oblong outline and parallel lateral margins.

Tetmemorus laevis (Kutz.) Ralfs var. *borgei* Kurt Först., Brit. Desm.: 146, pl. 24, fig. 3. 1848.

Closterium leave Kutz. 132, 1845.

Fig. 76-77

Cells ca. 3 times longer than wide (46-54 µm long by 15-17.5 µm wide) isthmus 12.5-15 µm wide, median constriction shallow, median sinus closed; semicell subrectangular, lateral margins smooth, parallel to each other, apical margins rounded, a single median incision, shallow, closed; cell walls hyaline, punctuated.

Distribution in Brazil: Bahia (Martins & Bicudo 1987); Rio de Janeiro (Sophia 1991).

Material selected: **Brazil. Bahia:** Mata de São João, APA Litoral Norte, 11/I/2009, Oliveira & Moura s.n. (HUEFS 155599); Entre Rios, APA Litoral Norte, 26/VII/2009, Oliveira *et al.* s.n. (HUEFS 155776, HUEFS 155779); Conde, APA Litoral Norte, 02/VIII/2009, Oliveira & Moura s.n. (HUEFS 155802).

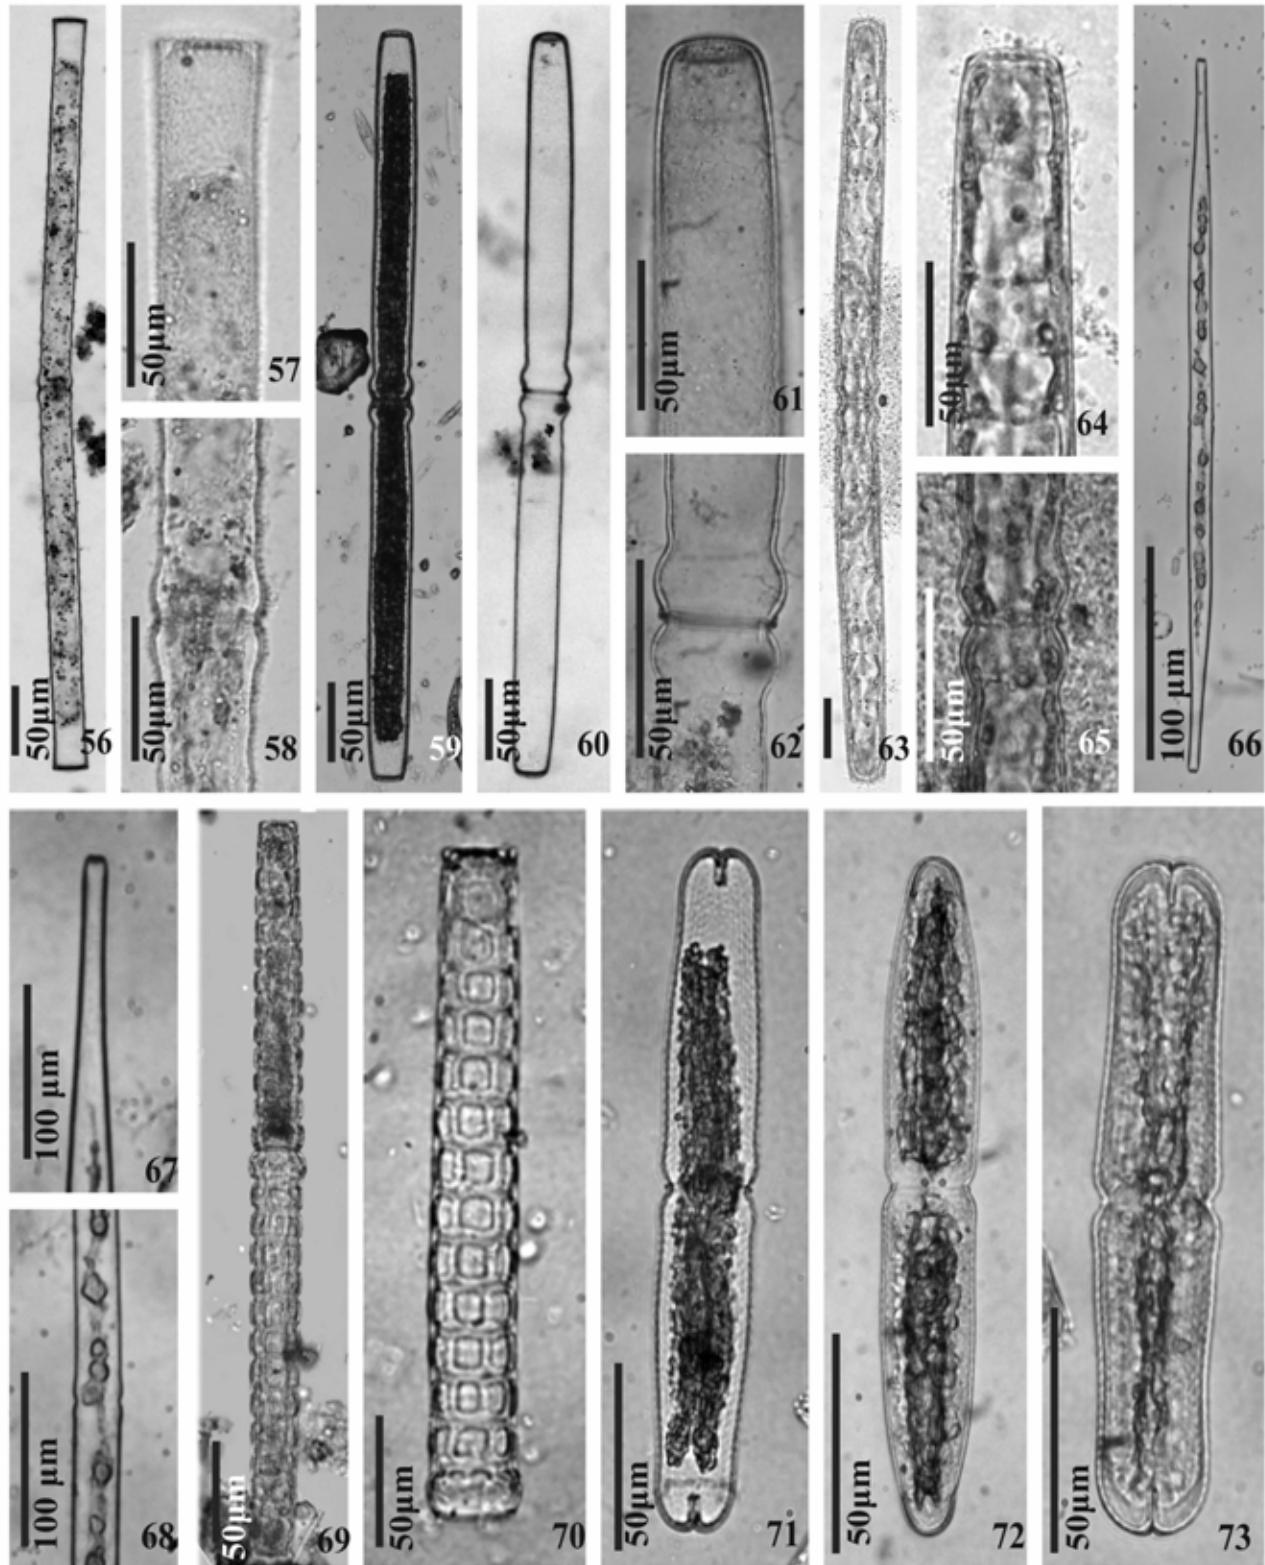

Tetmemorus laevis var. *borgei* is very similar to the variety *minutus* of the same species, differing, however, by having oblong cells, parallel lateral margins, and a poorly defined isthmus.

Tetmemorus laevis (Kutz.) Ralfs var. *minutus* (De Bary) Willi Krieg. Brit. Desm.: 146, fig. 3; pl. XXIV. 1848.

Closterium leave Kutz. Phyc. Germ., 132. 1845.

Fig. 78-79

Cells 3.2-3.4 times longer than wide (50-60 µm long by 15-20 µm wide), isthmus 12.5-18.5 µm wide, median constriction shallow, median sinus open; semicell oblong, lateral margins smooth, parallel to each other, apical mar-

Figures 56-58. Fig. 56. *Pleurotaenium simplicissimum* Grönblad var. *insigne* (Y.V. Roll) Willi Krieg; Fig. 57. Detail of the apex; Fig. 58. Detail of the isthmus; Figures 59-62. *Pleurotaenium trabecula* (Ehrenb.) ex Nägeli var. *trabecular* f. *trabecula*; 61. Detail of the apex, 62. Detail of the isthmus; Fig. 63-65. *Pleurotaenium trabecula* var. *elongata* Cedergr. f. *elongatum*; 64. Detail of the apex, 65. Detail of the isthmus; Fig. 66-68. *Pleurotaenium tridentulum* (Wolle) West var. *tenuissimum* Grönblad & Croasdale; 67. Detail of the apex, 68. Detail of the isthmus; Fig. 69 and 70. *Pleurotaenium verrucosum* (Bailey) P. Lundell var. *verrucosum* f. *verrucosum*; 70. Detail of cell wall ornamentation; Fig. 71 and 72. *Tetmemorus brebissonii* (Menegh.) Ralfs ex Ralfs var. *brebissonii*; 71. Lateral taxonomic view; Fig. 73. *Tetmemorus brebissonii* (Menegh.) Ralfs ex Ralfs var. *minor* De Bary.

gins rounded, a single median incision, shallow, closed; cell walls hyaline, punctuated.

Distribution in Brazil: Acre (Förster 1969); Pará (Scott *et al.* 1965); Rio Grande do Sul (Borge 1903; Sophia *et al.* 2005); Roraima (Förster 1963).

Material selected: **Brazil. Bahia:** Mata de São João, APA Litoral Norte, 14/III/2009, Oliveira & Moura s.n. (HUEFS 155703); Entre Rios, APA Litoral Norte, 26/VII/2009, Oliveira *et al.* s.n (HUEFS 155776, HUEFS 155779); Conde, APA Litoral Norte, 02/VIII/2009, Oliveira & Moura s.n. (HUEFS 155802).

Tetmemorus laevis var. *minutus* is very similar to the variety *borgei* of the same species, differing, however, by having cells that are attenuated towards the apex, with slight median swelling, and an open isthmus.

Förster (1963) described organisms with smaller cell dimensions (37-43 µm × 12.5-13 µm) than those found for the material from Bahia.

Triploceras Bailey, 1851

Triploceras gracile Bailey var. *bidentatum* (Nordst.) Nordst. Bot. Notiser 1887: 163. 1887.

Pleurotaenium bidentatum Nordst. Öfvers. VetenskAkad. Förh. 34(3): 18, pl. 2, fig. 3. 1877.

Fig. 80-82

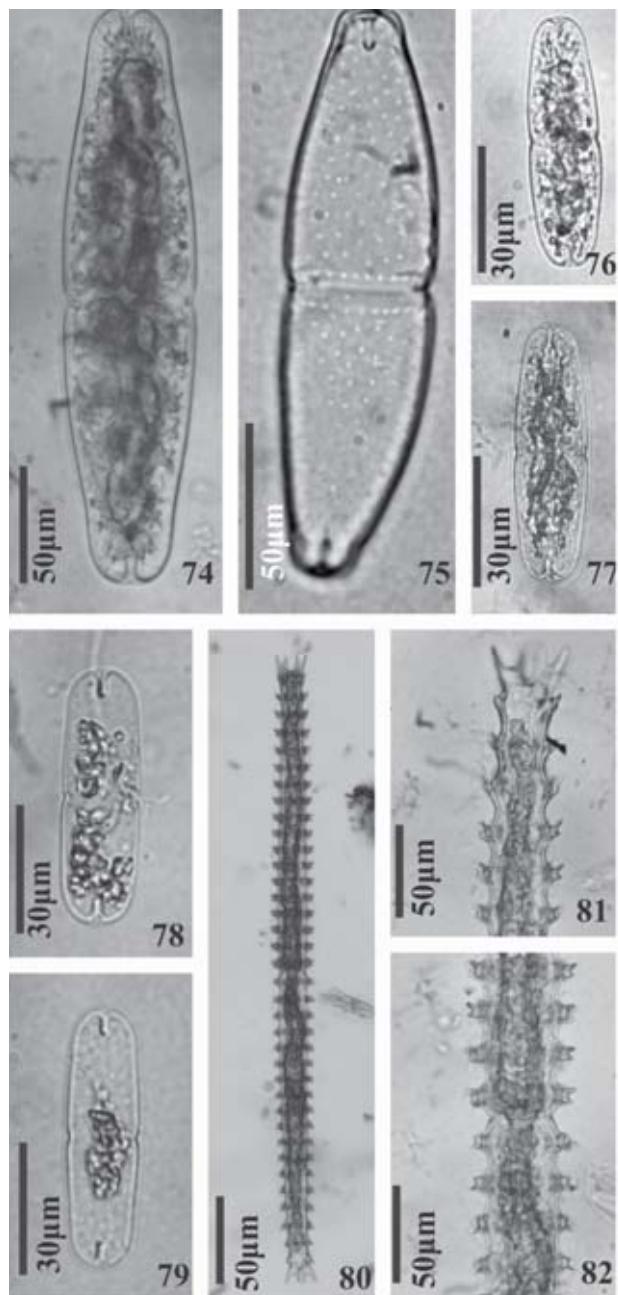

Cells ca. 14-16 times longer than wide (450-590 µm long by 30-38 µm wide), apex 27.5-42 µm wide, isthmus 25.5-38 µm wide, slight median constriction, conspicuous; semicells gradually narrowing towards the apex, 10-14 inferior verticils, 8-10 spines, 2-furcated vertically in each verticil, upper portion larger, curved upwards, inferior portion reduced, horizontal or curved outward, 4-6 superior verticils of simple spines, curved upwards, apex of the semi-cell divided into two short processes, each with 1-2 simple spines, long, and one short spine between the long ones; cell walls hyaline, smooth, sometimes finely punctuated; axial stellate chloroplast; no pyrenoids observed.

Distribution in Brazil: Amazonas (Thomasson 1971; Förster 1969, 1974; Martins 1980); Mato Grosso (Borge 1925); Minas Gerais (Nordstedt 1869); Pará (Scott *et al.* 1965); São Paulo (Börgensen 1890; Borge 1918; Bicudo *et al.* 1998).

Material selected: **Brazil. Bahia:** Mata de São João, APA Litoral Norte, 11/I/2009, Oliveira & Moura s.n. (HUEFS 155598, HUEFS 155599, HUEFS 155610); 15/II/2009, Oliveira & Farias s.n. (HUEFS 155625).

This taxon differs from the typical variety of the species by having vertically bifurcated spines, the upper portion of the semicell having larger, bifurcated spines that are curved upwards, whereas the lower portion has smaller, horizontal or vertical spines, the apex of the semicell having two apical processes.

Of the 32 taxa identified, three are new additions to the algal flora of Brazil (*Haploetaenium minutum* var. *minutum* f. *maiis*; *Ichthyocercus angolensis*; and *Pleurotaenium coronatum* var. *nodulosum*). Geographical distributions were

Figures 74-82. Fig. 74. *Tetmemorus granulatus* (Bréb.) Ralfs var. *attenuatus* West; Fig. 75. *Tetmemorus laevis* (Kütz.) Ralfs var. *laevis*; Fig. 76 and 77. *Tetmemorus laevis* var. *borgei* Kurt Först.; Fig. 78, 79. *Tetmemorus laevis* var. *minutus* (De Bary) Willi Krieg; Fig. 80-82. *Triploceras gracile* Bailey var. *bidentatum* (Nordst.) Nordst.: 81. Detail of the apex, 82. Detail of the isthmus.

expanded to include the northeastern region of the country for 20 taxa: *Docidium baculum* var. *baculum*; *Haploetaenium minutum* var. *cylindricum*; *H. minutum* var. *excavatum*; *H. minutum* var. *gracile*; *H. minutum* var. *latum*; *Pleurotaenium caldense* var. *cristatum*; *P. coroniferum*; *P. ehrenbergii* var. *ehrenbergii*; *P. ehrenbergii* var. *elongatum*; *P. gloriostum*; *P. nodosum* var. *borgei*; *P. ovatum* var. *ovatum*; *P. sceptrum* var. *sceptrum*; *P. simplicissimum* var. *insigne*; *P. trabecula* var. *elongatum* f. *elongatum*; *P. trabecula* var. *rectum*; *P. verrucosum*

var. verrucosum f. *verrucosum*; *Tetmemorus laevis* var. *laevis*; *T. laevis* var. *minutus*; and *T. gracile* var. *bidentatum*.

The genus *Docidium* has now been documented for the state of Bahia, and nine of the 13 taxa previously reported for the state were confirmed: *Haplotaenium minutum* var. *minutum* f. *minutum*; *H. minutum* var. *crassum* f. *crassum*; *Pleurotaenium ehrenbergii* var. *elongatum*; *P. trabecula* var. *trabecula* f. *trabecula*; *P. trabecula* var. *elongatum* f. *elongatum*; *Tetmemorus brebissonii* var. *brebissonii*; *T. brebissonii* var. *minor*; *T. granulatus* var. *attenuatus*; and *T. laevis* var. *borgei*.

Acknowledgments

The authors would like to thank the *Universidade Estadual de Feira de Santana* (UEFS, [Bahia] State University of Feira de Santana) and the Botanical Institute of the São Paulo State Department of the Environment for their logistical support. This study received financial support from the UEFS Graduate Program in Botany, for the fieldwork, as well as from the Brazilian *Coordenação de Aperfeiçoamento de Pessoal de Nível Superior* (CAPES, Office for the Advancement of Higher Education; doctoral scholarship to IBO).
