ABSTRACT. A new species of *Scinax* Wagler, 1830 belonging to the *S. catharinae* species group is described from the state of Goiás, in the Cerrado Biome, Brazil. *Scinax skaios* sp. nov. is characterized by short snout-vent length (males ranging 23.2–29.6 mm; females 30.7–36.1 mm), snout subovoid in dorsal view and protruding in lateral view; no tubercle on *canthus rostralis*; an inverted triangular interorbital blotch; no externally expanded vocal sac; dorsal skin texture moderately rugose; absence of a thick externally well differentiated inguinal gland; hidden areas of the thigh with vermiculate color pattern. The descriptions of the vocalizations are provided.

KEY WORDS. Amphibians; Cerrado; Dendropsophini; new species; *Scinax skaios* sp. nov.; vocalization.

Scinax Wagler, 1830 is the largest genus of Hylinae with about 90 species occurring from eastern and southern Mexico to Argentina and Uruguay, Trinidad and Tobago, and St. Lucia Island (FROST 2010). New species are frequently described (e.g. PUGLIESE *et al.* 2004, 2009, LIMA *et al.* 2005, BRASILEIRO *et al.* 2007, DRUMMOND *et al.* 2007). FAIVOVICH *et al.* (2005) based on molecular characters and some morphological features recognized two clades: the *S. catharinae* clade and the *S. ruber* clade. Within the *S. catharinae* clade, they recognized the *S. catharinae* and the *S. perpusillus* species groups. As currently recognized, the *S. catharinae* species group is the largest in the genus, comprising 28 species distributed in eastern and central Brazil, northeastern Argentina, southern Paraguay, and Uruguay (FROST 2010). Most species are found in the Atlantic Rainforest Domain (*sensu* AB'SÁBER 1977) and are typically forest dwellers. The species presently allocated to this species group are *S. agilis* (Cruz & Peixoto, 1983), *S. albicans* (Bokermann, 1967), *S. angrensis* (B. Lutz, 1973), *S. argyreornatus* (Miranda-Ribeiro, 1926), *S. ariadne* (Bokermann, 1967), *S. aromothyella* Faivovich, 2005, *S. berthae* (Barrio, 1962), *S. brieni* (De Witte, 1930), *S. canastrensis* (Cardoso & Haddad, 1982), *S. carnevallii* (Caramaschi & Kisttemacher, 1989), *S. catharinae* (Boulenger, 1888), *S. centralis* Pombal & Bastos, 1996, *S. flavoguttatus* (A. Lutz & B. Lutz, 1939), *S. heyeri* (Peixoto & Weygoldt in Weygoldt, 1986), *S. hiemalis* (Haddad & Pombal, 1987), *S. humilis* (B. Lutz, 1954), *S. jureia* (Pombal & Gordo, 1991), *S.*

kautskyi (Carvalho-e-Silva & Peixoto, 1991), *S. littoralis* (Pombal & Gordo, 1991), *S. longilineus* (B. Lutz, 1968), *S. luizotavioi* (Caramaschi & Kisttemacher, 1989), *S. machadoi* (Bokermann & Sazima, 1973), *S. obtriangulatus* (B. Lutz, 1973), *S. ranki* (Andrade & Cardoso, 1987), *S. rizibilis* (Bokermann, 1964), *S. strigilatus* (Spix, 1824), *S. trapicheiroi* (B. Lutz, 1954), and *S. tripui* Lourenço, Nascimento & Pires, 2009.

During field work in central Brazil in 2005, we (RRC and MASC) collected specimens of the *Scinax catharinae* species group at Santa Rita do Novo Destino, state of Goiás, Central Brazil. These are different from all other recognized taxa in the species group and are described herein. This new species and *S. centralis* are the most inland taxa found in gallery forest from Cerrado Domain, in Brazil (see POMBAL & BASTOS 1996).

MATERIAL AND METHODS

Specimens used in the description or examined for comparisons are deposited in the Adolpho Lutz Collection (AL-MN, housed in Museu Nacional, Rio de Janeiro, Brazil), Museu de Ciências Naturais da PUC Minas (MCNAM, Belo Horizonte, Minas Gerais, Brazil), and Museu Nacional (MNRJ, Rio de Janeiro, Brazil).

The following measurements were taken with calipers: SVL (snout-vent length), HW (head width), HL (head length), THL (thigh length), TBL (tibia length), and FL (foot length).

Six others variables, ED (eye diameter), IOD (interorbital distance), IND (internarial distance), END (eye-nostril distance), NSD (nostril-snout distance), and TD (tympanum diameter), were measured using an ocular micrometer in a Zeiss stereomicroscope. All measurements are in millimeters and followed DUELLMAN (2001) and CEI (1980). Webbing formula notation follows SAVAGE & HEYER (1967), as modified by MYERS & DUELLMAN (1982). The sex was determined by smaller size and forearm more robust in males and in females was made a small lateral incision on abdomen to visualize the egg mass.

Vocalizations of two males were recorded with a Panasonic RQ-L309 portable tape recorder. The vocalizations were edited at a sampling frequency of 22 kHz and 16 bits resolution with a PC-Pentium computer and analyzed with Avisoft-Sonagraph Light and Cool Edit 96 software. The oscilogram and sonogram was produced with 256 points, 50% overlap, and in flat top.

TAXONOMY

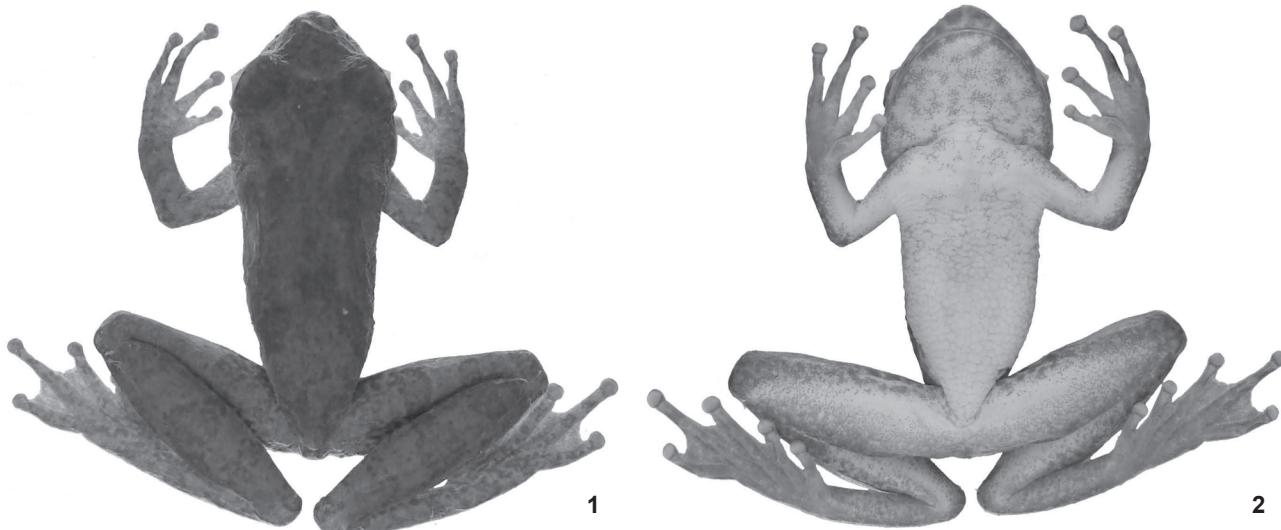

Scinax skaios sp. nov.

Figs 1-6

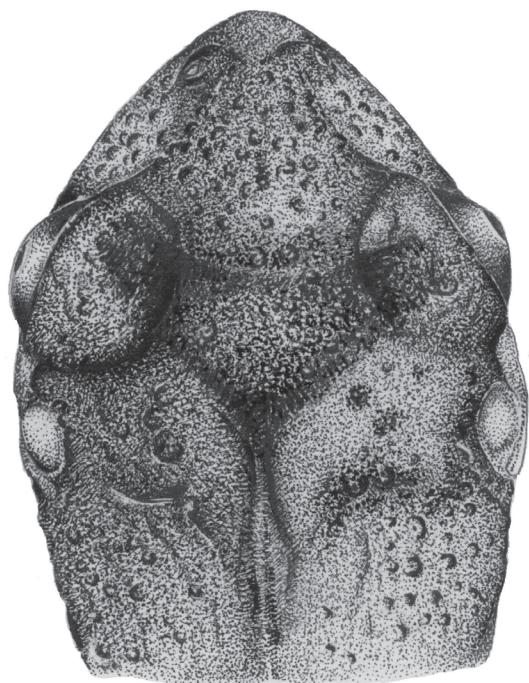

Holotype. MNRJ 54471, female, collected at Anglo American do Brasil (15°05'17"S, 49°02'23"W), municipality of Santa Rita do Novo Destino, state of Goiás, Brazil, 28.VI.2005, Ronald R. Carvalho Jr & Marco Antônio S. Canelas leg. Paratotypes. MCNAM 6220-6221 (one female and one male), 22.VI.2005; MCNAM 6222-6223 (one male and one female), 28.VI.2005; MCNAM 6225 (one female), 28.VI.2005; MCNAM 6227 (one female), 28.VI.2005; MCNAM 6229-31 (three males), 28.VI.2005; MCNAM 6233 (one female), 28.VI.2005; MNRJ 54472-74 (one male and two females), 28.VI.2005. All collected at the type locality by the same collectors.

Diagnosis. A small species (SVL of males 23.2-27.6 mm and females 29.7-36.1 mm) belonging to the *Scinax catharinæ* species group, characterized by snout subovoid in dorsal view and protruding in lateral view; no tubercle on the *canthus rostralis*; an inverted triangular interorbital blotch; no vocal sac expanded externally; dorsal skin texture moderately rugose; absence of a thick externally well differentiated inguinal gland; hidden areas of thigh with vermiculate pattern.

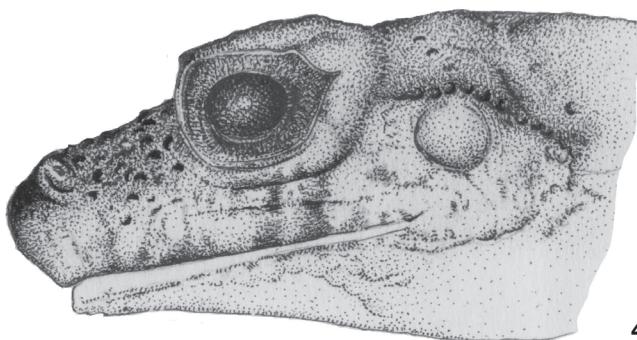

Comparison with other species. *Scinax skaios* can be separated from *S. agilis*, *S. argyreornatus*, *S. berthae*, *S. centralis*, and *S. machadoi* by the greater male SVL (male combined SVL 13.5-22.2 mm in those species; BOKERMANN & SAZIMA 1973, CRUZ & PEIXOTO 1983, POMBAL & BASTOS 1996, FAIVOVICH 2005). By contrast, can be distinguished from *S. ariadne* and *S. catharinæ* by the smaller male SVL (male combined SVL 33.0-36.5; B. LUTZ 1973, where *S. ariadne* was called *Hyla catharinæ bocainensis*). It can be separated from *S. albicans*, *S. flavoguttatus*, *S. longilineus*, and *S. strigilatus* by the smaller female (female combined SVL 36.9-43.1; B. Lutz 1973, where *S. albicans* was called of *Hyla catharinæ opalina*; ANDRADE & CARDOSO 1990, PIMENTA et al. 2007). *Scinax skaios* further differs from *S. longilineus* by the less rugose dorsal skin, (moderately rugose in *S. skaios*). The lack of thick, externally well differentiated inguinal glands distinguishes *S. skaios* from *S. centralis* and *S. hiemalis* (POMBAL & BASTOS 1996, HADDAD & POMBAL 1987). The slightly visible and inverted triangular interocular blotch differentiates the new species from *S. angrensis*, *S. flavoguttatus*, *S. heyeri*, *S. humilis*, *S. kaustkyi*, *S. littoralis*, and *S. tripui* (in these species the interocular blotch is W-shaped, sometimes interrupted; (B. LUTZ 1973, PEIXOTO & WEYGODT 1987, CARAMASCHI & KISTEUMACHER 1989, CARVALHO E SILVA & PEIXOTO 1991, POMBAL & GORDO 1991, LOURENÇO et al. 2009) and from *S. trapicheiroi*, in which the interocular blotch is very large,

Figures 3-6. *Scinax skaios* sp. nov., holotype (MNRJ 54471): dorsal (3) and lateral (4) views of head; ventral views of hand (5) and foot (6). Scale = 5 mm.

extending well onto to the scapular region (B. LUTZ 1973). Further, *S. skaios* differs from *S. flavoguttatus* and *S. heyeri* by lacking vivid orange color on the hidden surfaces of the thigh (B. LUTZ 1973, PEIXOTO & WEYGOLDT 1987). The lack of an externally distended vocal sac distinguishes *S. aromothyella* from the new species (FAIVOVICH 2005). The absence of an enlarged nuptial pad distinguishes *S. skaios* from *S. rizibilis*. Even though the male SVL of *S. skaios* and *S. luizotavioi* – males 21.8-24.3 mm SVL (CARAMASCHI & KISTEUMACHER 1989) sometimes overlap, *S. skaios* can be generally recognized by its larger size, less acuminate snout in dorsal view, skin of dorsum more rugose (smooth with tubercles scattered on the dorsum in *S. luizotavioi*), and vocal sac not expanded (lateral and slightly expanded in *S. luizotavioi*). The male SVL of *S. skaios* also overlaps with that of *S. carnevallii* – males 21.0-25.0 mm SVL (CARAMASCHI & KISTEUMACHER 1989). The former can be separated from the latter by generally being larger, having a more robust body, a less acuminate snout in lateral view, and by lacking two oblique white lines from the eye to the upper lip. From *S. jureia*, *S. skaios* differs by having a rugose dorsum (smooth in *S. jureia*) and a less developed supratympanic fold. The lack of a contrasting dorsal color pattern with light line drawing distinguishes the new species from *S. canastrensis*. From *S. ranki*, the new species can be distinguished by being larger, some overlapping occurs in *S. ranki* male SVL 20.2-24.8 mm (ANDRADE & CARDOSO 1987), and by the more rugose dorsal skin (smooth with tubercles scattered on dorsum in *S. ranki*), and vocal sac not expanded – lateral and slightly expanded in *S. ranki* (ANDRADE & CARDOSO 1987). *Scinax skaios* differs from *S. obtangulatus* by the less rounded head in dorsal view, the rugose skin, the medium-sized finger and toe discs (large in *S. obtangulatus*) and the less conspicuous dorsolateral stripes (very conspicuous in *S. obtangulatus*). The new species differs from *S. brieni* by smaller interocular blotch, small finger and toe discs (large in *S. brieni*); absence of a tubercle between eye-nostril (present in *S. brieni*), and smaller males – SVL of males 30.5-32.7 mm in *S. brieni* (HEYER et al. 1990). Further, the new species can be distinguished from all species of the *S. catharinae* group, except by *S. longilineus*, by the vermiculate color pattern in hidden areas of the thigh.

Description of the holotype. Body moderately slender; head slightly longer than wider and slightly wider than body; snout subovoid in dorsal view, protruding in lateral view; nostril protuberant, located laterally, immediately posterior to tip of snout; *canthus rostralis* well marked, nearly concave; loreal region concave; no tubercle on *canthus rostralis*; eyes protuberant, large; tympanum distinct, small round, larger than diameter of finger III disc; supratympanic fold well defined evident, extending from posterior corner of eye to just anterior to shoulder; tongue large, oval, free laterally and posteriorly, slightly notched behind; two transverse series of four vomerine teeth between the large elliptical choanae. Arms slender; forearms more robust than upper arms; fingers narrow; finger lengths I<II<IV<III; subarticular tubercles nearly conical; few small supernumerary

tubercles; outer metacarpal tubercle large and bifid; inner metacarpal tubercle large, nearly ovoid; finger discs medium-sized, nearly round; disc of finger I smaller than others; webbing between fingers absent. Legs slender, tibia longer than thigh; sum of thigh and tibia lengths greater than SVL; toes slender; toe length I<II<III<V<IV; subarticular tubercles round, protruding; outer metatarsal tubercle round, small; inner metatarsal tubercle small, nearly elliptical; toe discs medium-sized, approximately round; small supernumerary tubercles present; webbing formula 12-2II1-3-III1-2-IV2-1V. Pectoral fold absent; dorsal surfaces and flanks weakly rugose with scattered granules, mainly in sacral region and head where they are larger; gular region and chest finely granular; belly and ventral surfaces of thighs aureolate; inguinal glands not visible.

Color in life. Dorsum color ranged from beige or pale green to brown or dark brown, with irregular black spots; granules on dorsum brown, yellow, or orange; tympanum bronze; inverted triangular interorbital blotch dark brown, bordered by a narrow yellow line. Upper surfaces of arms and legs brown with irregular dark brown stripes. Hidden areas of thighs brown or pale green with vermiculate dark brown; belly white to light brown; throat whitish with brown dots; iris pale to dull bronze with black median vertical streaks (Fig. 7).

Figure 7. Adult female in life of *S. skaios* sp. nov. (MCNAM 6220) from the type-locality at municipality of Santa Rita do Novo Destino, state of Goiás, Brazil. Photo by RRC.

Color in preservative (70% alcohol). Color similar to those in life, but darker.

Variation. Measurements are in table I. The females are larger than males. The forearm is slightly more robust in males (width/forearm length 0.37-0.43 in females and 0.45-0.54 in males). The dorsum may be brown or dark brown. Skin on dor-

Table I. Measurements (mm) of holotype (MNRJ 54474) and paratypes of *S. skaios* sp. nov. (M) male and (F) female.

sum varied from smooth to tuberculate. About 75% of specimens (males and females) have a clear line between eyes. Supernumerary tubercles vary in number.

Vocalizations. Two types of vocalizations (Figs 8-11) were recorded: a long call (here considered the advertisement call because it was more frequent) and a short call (named isolated call). Two advertisement calls were recorded from two males. The duration of the two advertisement calls was 4.42 s and 7.9 s, which presented 42 and 73 notes. Average note duration was 0.27 ± 0.012 s (0.013-0.056, N = 10 notes), emitted on an interval of 0.087 ± 0.053 s (0.036-0.168 s, N = 10 intervals). The calls presented 312 or 612 pulses and notes had 9.2 ± 3.33 pulses (5-16, N = 10 notes). The dominant frequencies were 2.205 and 2.243 Hz.

Three isolated calls were recorded from two males and showed pulsed structure with duration of 0.036 ± 0.017 s (0.017-0.049 s, N = 3 calls) and 14.43 ± 5.69 pulses (8-19 pulses, n = 3 calls). The dominant frequency varied from 2.310 to 2.348 Hz ($X = 2,323 \pm 52$ Hz). Vocalizations of the following species of the *Scinax catharinae* group are described: *S. albicans* (HEYER 1980), *S. argyreornatus* (BOKERMANN 1966, POMBAL *et al.* 1995), *S. canastrensis* (CARDOSO & HADDAD 1982), *S. catharinae* (HEYER 1980), *S. centralis* (POMBAL & BASTOS 1996), *S. hiemalis* (HADDAD & POMBAL 1987), *S. machadoi* (BOKERMANN & SAZIMA 1973), *S. ranki* (ANDRADE & CARDOSO 1987), *S. rizibialis* (BOKERMANN 1964, POMBAL *et al.* 1995, BASTOS & HADDAD 2002). Vocalizations of species this group are complex (POMBAL *et al.* 1995, POMBAL & BASTOS 1996). Given that the available descriptions are based on different equipments and the acoustic parameters differ between studies (see POMBAL *et al.* 1995 for revision) we have avoided a detailed comparison among these

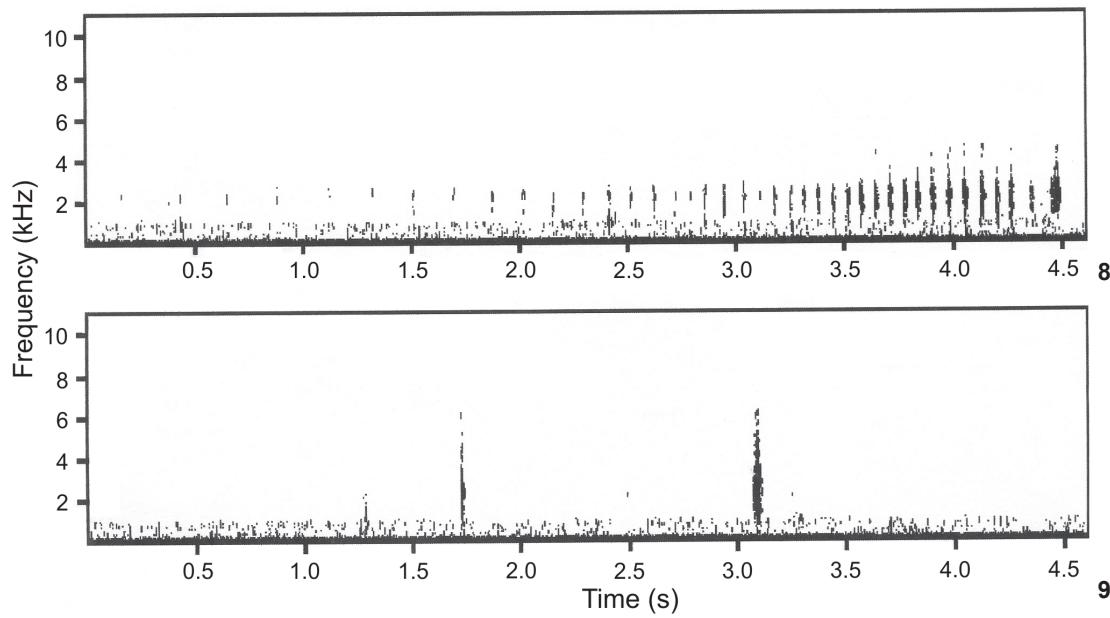

vocalizations. With one exception (see below), the advertisement call of *Scinax skaios* differs from all calls described so far by having more notes per call. The advertisement call of *S. argyreornatus* shares this feature, but it can be distinguished by its lower dominant frequency (POMBAL *et al.* 1995).

Habitat and natural history. The Cerrado Biome covers about 2 million km², representing 22% of Brazil, plus small areas in eastern Bolivia and northwestern Paraguay. It extends from the southern borders of the Amazonian forest to areas in the southern states of São Paulo and Paraná. The distribution of the Cerrado is coincident with the plateau of central Brazil. Narrow forest strips are called "gallery forest" because the crowns of the trees form a gallery over the water of small rivers or rivulets. The central Brazilian riverine forests represent floristic intrusions of the Amazonian and/or Atlantic forest into the Cerrado Domain (OLIVEIRA-FILHO & RATTER 2002). *Scinax skaios* is the second species of the *S. catharinae* species group recorded only in the Cerrado biome (POMBAL & BASTOS 1996). Like *S. centralis*, *S. skaios* is encountered in gallery forests.

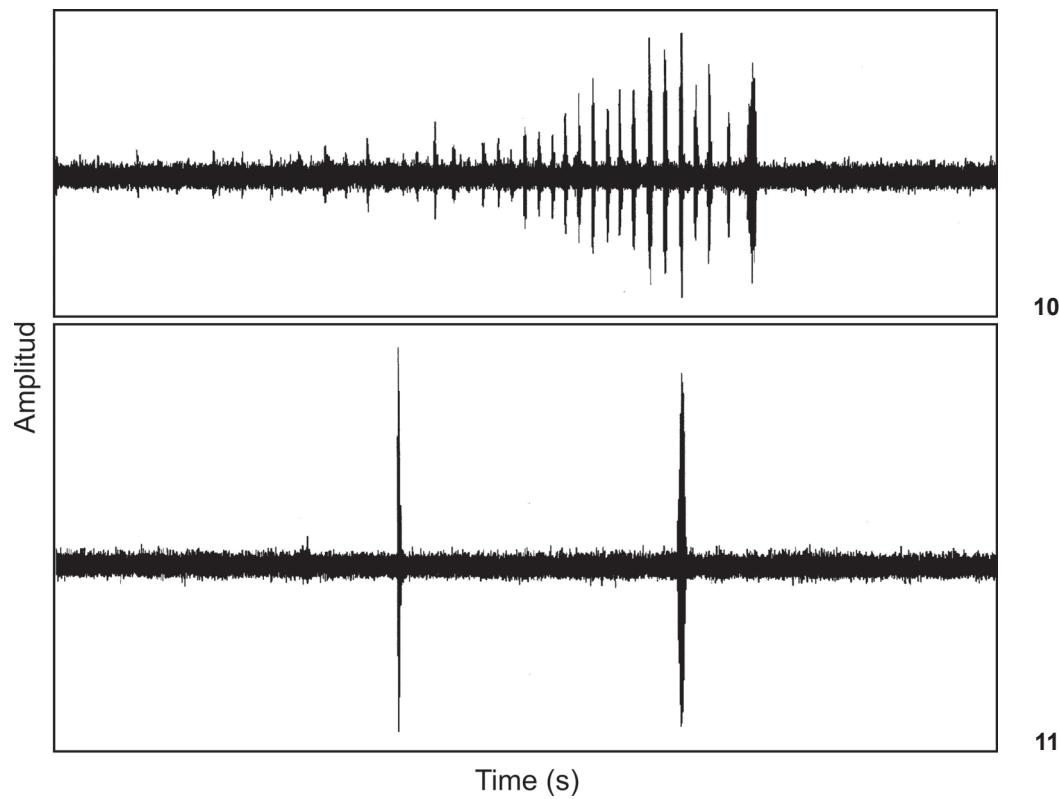

Males vocalized close to the rivulets in the gallery forests or in the cerrado near gallery forests. As vocalization site, the males utilized branches of marginal vegetation, rocks or ground (0-1.0 m above the water). The vocalizations could be heard starting around 21:00 h. The amplexus is axilar.

Distribution. The new species is known only from the type locality in the municipality of Santa Rita do Novo Destino, state of Goiás, Brazil.

Etymology. *Skaios* is a Greek word meaning western. Most of the species of the *Scinax catharinae* species group occur in the Atlantic Forest in eastern Brazil (POMBAL & BASTOS 1996).

Figures 8-9. Spectrogram of the advertisement call and isolated call of *S. skaios* sp. nov. (MCNAM 6221) from type locality at municipality of Santa Rita do Novo Destino, state of Goiás, Brazil, recorded on 22 June 2005. Air temperature 23.5° C.

Figures 10-11. Waveform of the advertisement call and isolated call of *S. skaios* sp. nov. (MCNAM 6221) from type locality at municipality of Santa Rita do Novo Destino, state of Goiás, Brazil, recorded on 22 June 2005. Air temperature 23.5° C. The time is 4.5s.

ACKNOWLEDGEMENTS

We thank D.S. Fernandes, A.C.C. Lourenço, and M.W. Cardoso for helpful suggestions on the manuscript; P.R. Nascimento for the line drawings; D. Baêta and A.C.C. Lourenço for the pictures 1 and 2. We thank Anglo American do Brasil for the license to access the study area and for financial support. The Instituto Brasileiro do Meio Ambiente e dos Recursos Naturais Renováveis/Centro de Conservação e Manejo de Répteis e Anfíbios (Ibama/RAN) provided capture/transportation license 079/2005-CGFAU/LIC. The Conselho Nacional de Desenvolvimento Científico e Tecnológico (CNPq) provided fellowships to JPP and RPB. Financial supports were provided by ANPCy PICT 2007/2202, CNPq, Funape/UFG, Fundação Carlos Chagas Filho de Amparo à Pesquisa do Estado do Rio de Janeiro (FAPERJ), and CNPq.
