Abstract: *Platyphora* Gistel, 1857 is the largest genus in Chrysomelinae with about 450 species of which 181 occur in Brazil. The Itatiaia National Park is one of the most important Conservation Units of the Atlantic Rainforest and 36 *Platyphora* species are recorded from the park. We have recorded 38 species of *Platyphora*. The synonymy of *Platyphora fraterna* (Stål, 1857) and *Platyphora fasciatomaculata* (Stål, 1857) is proposed. *Platyphora bilimbata* (Stål, 1857), *P. carolina* (Stål, 1858) and *P. semiviridis* (Jacoby, 1903) are new records for the park; additional distributional records are provided for 18 species. Of the 38 species, 24 are illustrated for the first time.

***Platyphora* Gistel, 1857 do Parque Nacional do Itatiaia, Sudeste do Brasil: nova sinonímia e novos registros (Insecta, Coleoptera, Chrysomelidae)**

Resumo: *Platyphora* Gistel, 1857 é o gênero em Chrysomelinae com maior número de espécies, cerca de 450, onde 181 ocorrem no Brasil. O Parque Nacional do Itatiaia é uma das mais importantes unidades de conservação da Mata Atlântica e apresenta 36 espécies de *Platyphora* registradas. Neste trabalho registramos 38 espécies de *Platyphora*. É proposta a sinonímia entre *Platyphora fraterna* (Stål, 1857) e *Platyphora fasciatomaculata* (Stål, 1857). *Platyphora bilimbata* (Stål, 1857), *P. carolina* (Stål, 1858) e *P. semiviridis* (Jacoby, 1903) são novos registros para o parque e são assinalados novos registros de distribuição para 18 espécies. Das 38 espécies, 24 são ilustradas pela primeira vez.

Introduction

The family Chrysomelidae contains about 40,000 species in 12 subfamilies: Bruchinae, Cassidinae, Chrysocephalinae, Chrysomelinae, Criocerinae, Donaciinae, Eumolpinae, Galerucinae, Lamprosomatinae, Sagrinae, Spilopyrinae and Syinetinae (Bouchard et al. 2011, Chaboo et al. 2014). Chrysomelinae consists of 150 genera and about 3,000 species, with 544 species recorded in Brazil (Chaboo et al. 2014, Reid 2014, Sekerka 2016). *Platyphora* Gistel, 1857 is among the most species-rich genera in Chrysomelinae, with about 450 species, 181 of them recorded for Brazil (Blackwelder 1946, Daccordi 1994, Sekerka 2016, Sampaio & Monné 2017).

Itatiaia National Park (PNI) is the oldest national park in Brazil, established in 1937, and one of the most important Conservation Units of the Atlantic Rainforest (ICMBio 2013). The Atlantic Rainforest is one of the most relevant eco-regions in the world, a biodiversity hotspot, and is considered one of the most threatened biomes on the planet (Morellato & Haddad 2000). Concerning the beetle fauna in the PNI, knowledge of the species of Chrysomelinae is limited. A single paper published by Zikán & Zikán (1967) listed 77 species of Chrysomelinae;

of these, 34 are members of *Platyphora*. Of these species, two were synonymized by Bechyné (1948, 1950a) and five species and one subspecies had previously been recorded for the park: *P. notaticollis* (Stål, 1858), *P. congener* (Stål, 1858), *P. manhumirim* Bechyné, 1958, *P. pastica bourcieri* (Guérin-Méneville, 1855), *P. placida* (Stål, 1858) and *P. quadrifasciata* (Germar, 1823) (Bechyné 1951a, Bechyné & Bechyné 1965). Sampaio & Monné (2017) proposed the synonymy of *Platyphora cliens* (Stål, 1858) and *Platyphora congener* (Stål, 1858). Thirty-six species of *Platyphora* are recorded for the PNI.

This contribution presents a revision of the literature on *Platyphora* species from Itatiaia National Park, providing new distribution data and illustrations of the species. This information gives us a better understanding of which species are being protected within the national park.

Material and Methods

The Itatiaia National Park (PNI) is located between 22°19'–22°45' S and 044°15'–044°50' W, and covers part of southwestern Rio de Janeiro, in the county of Itatiaia, and southeastern Minas Gerais, in the counties of Itamonte, Alagoa and Bocaina de Minas. The park is surrounded by

the Mantiqueira Range Environmental Protection Area, which provides an ecological buffer zone for the park (ICMBio 2013).

The species were identified based on the original description, redescriptions, and by comparison with type material. In total, 842 specimens and photographs of 22 types (11 holotypes and 11 syntypes), provided by the curators of the respective collections, and the paratype of *P. manhumirimana* Bechyné, 1958 from MZSP were studied. The list of species is presented in alphabetical order, and all references are included in a catalog list, with the information presented in the following format: author, publication year, and page. This is followed by the type of study, indicated by one of the following abbreviations: biological data (biol.); catalogue (cat.); geographical distribution (distr.); host plant (host); key to aberration (key ab.); checklist online (check.) and synonym (syn.).

Results

Of the 36 species of *Platypthora* previously recorded for Itatiaia National Park, *P. fulgora* (Stål, 1858) was erroneously recorded by Zikán & Zikán (1967); this species occurs only in Colombia. A total of 38 species of *Platypthora* are recorded for the park. The synonymy of *Platypthora fraterna* (Stål, 1857) and *Platypthora fasciatomaculata* (Stål, 1857) is proposed. *Platypthora bilimbata* (Stål, 1857), *P. carolina* (Stål, 1858) and *P. semiviridis* (Jacoby, 1903) are new records for the PNI, and new additional records are provided for 18 species. The study of *P. nigripes* (Stål, 1857) and *P. vidanoi* Daccordi, 1994 were restricted to the literature, and of *P. jucunda* (Stål, 1857) to photographs of the type. Of the 38 species, 24 are illustrated for the first time; and a complete list of bibliographic references for the species is also provided for the first time.

Chrysomela avara Stål, 1863: 92 (syn.).

The original descriptions of *Doryphora fraterna* Stål, 1857 and *Doryphora fasciatomaculata* Stål, 1857 are very similar, and only some differences were related to the color of the dorsum. Comparisons of photographs of the syntypes of *D. fraterna* (Figures 3D-3I) and of the holotype of *D. fasciatomaculata* (Figures 3K-3M), and the comparative examination of 77 specimens helped us to determine that the differences between these taxa are due only to intraspecific variation (Figures 3D-4A). Also, the male genitalia of specimens from various localities (Minas Gerais, Rio de Janeiro, São Paulo, Santa Catarina and Rio Grande do Sul) were dissected and no differences were observed. Therefore, *Doryphora fasciatomaculata* is here considered a synonym of *Doryphora fraterna*.

Geographical distribution: Bechyné (1950a, 1951a, 1952, 1953, 1954, 1958) recorded the species for Brazil (Minas Gerais, Rio de Janeiro, São Paulo and Santa Catarina) and Argentina (Misiones). New records for Espírito Santo and Rio Grande do Sul.

Type material: We examined photographs of the syntypes of *P. fraterna* (Figures 3D-3I) from Brazil (Rio de Janeiro) and the holotype of *P. fasciatomaculata* (Figures 3K-3M) from Brazil taken by Dr Johannes Bergsten (NHRS).

Acknowledgements

We thank Dr. Johannes Bergsten (NHRS), Joachim Willers (ZMHB) and Dr. Antoine Mantilleri (MNHN) for the photographs of the types; Dr. José Ricardo Mermudes (DZRJ), Márcio Felix (FIOC), Sônia Casari (MZSP), Carlos Campaner (MZSP), Harald Schilhammer (NHMW) and Michael Balke (ZSMC) for the loan of material; and the project Informatização da Coleção Entomológica do Museu Nacional / UFRJ, SIBBR / CNPq proc. 405588 / 2015-1 for the use of photographic equipment.

Authors Contributions

Aline Amanda Sampaio: substantial contribution in the concept and design of the study; contribution to data collection; contribution to data analysis and interpretation; contribution to manuscript preparation and critical revision.

Marcela Laura Monné: contribution to data analysis and interpretation; contribution to manuscript preparation and critical revision.

Conflict of Interest

The authors declare that they have no conflict of interest related to the publication of this manuscript.
